

BC Optidrive

AC Variable Speed Drive 0.75kW – 250kW / 1HP – 350HP 200 – 480 Volt 1 & 3 Phase

This Document is for use with version 2.10 Firmware.

Advanced User Guide Revision 1.00

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

Revision History

Revision	Note
1.00	First Draft

This user guide is intended to provide technical information and explanation of the operation and parameters of the Optidrive Eco product range. The information contained withn is intended to reflect the latest available firmware functionality at the time of release. This user guide must be read in conjunction with the Optidrive Eco User Guide included with each product, and in particular, all relevant safety information and warnings. The information is intended to reflect the product as accurately as possible, however Invertek Drives accepts no liability for information contained herein.

This document is intended for persons who are already familiar with the installation, mounting, start-up and operation of the equipment and the hazards involved. The reader should be trained and in the operation of electrical equipment, and heave the necessary authority to energize, de-energize, clear, ground and tag circuits and equipment in accordance with established safety procedures. In addition, they should be trained in the proper care and use of protective equipment in accordance with established safety procedures.

1.1. About this section

This document provides a list of the available parameters, and a description of their respective functions, for the Optidrive Eco.

1.2. Parameter Structure Overview

The parameter set is arranged in Groups according to the following structure

Parameter Group	Range	Name	Access Level	Access Type
Group 0	P0-01 to P0-50	Basic Monitoring	Extended	Read Only
	P0-51 to P0-80	Advanced Monitoring	Advanced	Read Only
Group 1	P1-01 to P1-14	Quick Start Menu	Basic	Read / Write
Group 2	P2-01 to P2-40	Extended Parameters	Extended	Read / Write
Group 3	P3-01 to P3-18	PID Controller	Extended	Read / Write
Group 4	P4-01 to P4-14	Motor Control	Extended	Read / Write
Group 5	P5-01 to P5-15	Communications	Extended	Read / Write
Group 6	P6-01 to P6-30	Advanced Functions	Advanced	Read / Write
Group 7	P7-01 to P7-19	Advanced Motor Data	Advanced	Read / Write
Group 8	P8-01 to P8-20	Application Specific Group	Advanced	Read / Write
Group 9	P9-01 to P9-44	Programmable Logic	Advanced	Read / Write

Access to all parameter groups is controlled by setting P1-14 as follows P1-14 = P2-40 (Factory setting: 101) Allows Extended Parameter Access

P1-14 = P6-30 (Factory Setting: 201) Allows Advanced Parameter Access

1.3. Parameter Descriptions

1.3.1. Parameter Group 1 – Basic Parameters Minimum Par. Maximum Default Units Name P1-02 P1-01 **Maximum Frequency / Speed Limit** 500.0 / 30000 50.0 (60.0) Hz / Rpm Maximum output frequency or motor speed limit – Hz or rpm. If P1-10 > 0, the value entered / displayed is in Rpm The value which may be entered by the user is limited by the lower of the following :-5 x P1-09 value OR P2-24 / 16 P1-02 **Minimum Frequency / Speed Limit** 0.0 P1-01 0.0 Hz / Rpm Minimum speed limit – Hz or rpm. If P1-10 >0, the value entered / displayed is in Rpm P1-03 **Acceleration Ramp Time** 0.0 6000 30 Seconds Acceleration ramp time from 0 to base speed (P-1-09) in seconds. P1-04 **Deceleration Ramp Time** 0.0 6000 30 Seconds Deceleration ramp time from base speed (P1-09) to standstill in seconds. When set to zero, fastest possible ramp time without trip is activated P1-05 Stop Mode 0 2 0 This parameter has several functions :-- To select the stopping mode (Ramp or Coast) - To enable the AC Flux Braking function 0: Ramp To Stop. When the enable signal is removed, the drive will ramp to stop, with the rate controlled by P1-04 as described above. 1: Coast to Stop. When the enable signal is removed, the drive output is immediately disabled, and the motor will coast (freewheel) to stop. If the load can continue to rotate due to inertia, and the drive may possibly be re-enabled whilst the motor is still rotating, the spin start function (P2-26) should be enabled. 2 : AC Flux Braking. AC Flux braking provides improved braking torque during stopping and deceleration. P1-07 **Motor Rated Voltage** See Below See Below Volts This parameter should be set to the rated (nameplate) voltage of the motor (Volts) The factory default setting of this parameter is drive model dependent as follows :-All kW & HP models intended for 200 – 240 volt operation (e.g. ODV-3-x2xxx-xxF1x-xN) : Factory setting = 230 Volts, Maximum 250 Volts All kW & HP models intended for 380 – 480 volt operation (e.g. ODV-3-x4xxx-3F1x-xN) : Factory setting = 400 Volts, Maximum 500 Volts When this parameter is set to the motor nameplate voltage, the output voltage from the drive is controlled automatically and maintained at the correct level wherever possible regardless of variations in supply voltage or DC Bus Voltage. When P1-07 = 0, the voltage compensation function of the inverter is disabled. The output voltage applied to the motor will increase or decrease with changes in the DC Bus voltage. Note The RMS output voltage from the inverter can never exceed the incoming supply voltage. P1-08 **Motor Rated Current** See Below Amps This parameter should be set to the rated (nameplate) current of the motor. The factory default setting of this parameter is the set to the maximum continuously available output current of the drive P1-09 500 **Motor Rated Frequency** 10 50 (60) Hz This parameter should be set to the rated (nameplate) frequency of the motor. The factory default setting of this parameter is drive model dependent as follows :-All kW models : Factory setting = 50Hz All HP models : Factory setting = 60 Hz P1-10 **Motor Rated Speed** 0 30000 Rpm This parameter can optionally be set to the rated (nameplate) rpm of the motor. When set to the default value of zero, all speed related parameters are displayed in Hz, and the slip compensation for the motor is disabled. Entering the value from the motor nameplate enables the slip compensation function, and the Optidrive display will now show motor speed in estimated rpm. All speed related parameters, such as Minimum and Maximum Speed, Preset Speeds etc. will also be displayed in Rpm.

P1-11	Torque Boost	0.0	See Below	See Below	%			
	This parameter is effective only when operating in Vector Mode (P4-01 = 0, 1 or 2).							
	Torque Boost is used to increase the applied motor voltage and hence motor current at low output frequencies. This can improve the							
	starting torque and torque at low speeds. Increasing the bo	oost level will increa	se the motor currer	nt at low speed, whi	ch may result in			
	the motor temperature rising – forced ventilation of the m	otor may then be re	quired. In general,	the lower the moto	r power, the			
	higher the boost setting that may be safely used.							
	This parameter has no affect when P4-01 is set to 3, 4 or 5							
	An automatic setting (RULo) is also possible, whereby the (Optidrive will autom	atically adjust this p	parameter based on	the motor			
	parameters measured during an autotune. To use the auto	omatic setting, P1-1	1 should be set to -1	1				
D1 12	Drimon Command Course Made	0	C	0				
P1-12	Primary Command Source Mode		0	0	-			
	U: Terminal Control. The drive responds directly to signals	applied to the conti	or terminals.	using an autornal ar	romata Kaunad			
	1. Uni-directional Keypad Control 1/2/3) The drive can be c	ontrolled in the form	vard direction only	using an external or	remote Keypau			
	2 : DID Control The output frequency is controlled by the i	nternal PID controll	or	using an external of	тепноте кеурай			
	4: Fieldhus Control. Control via Modbus RTU if no fieldhus	interface ontion is	oresent otherwise	control is from the f	fieldhus ontion			
	module interface		Siesent, otherwise					
	5 : Slave Mode The drive acts as a Slave to a connected Or	otidrive operating in	Master Mode					
	6 : BACnet MSTP Control. Control via BACnet bus connected	ed to the RI45 serial	interface connector	r of the drive				
	Note							
	1) When operating with P1-12 = 1 or 2, the drive wi	ll not operate the m	otor unless the ena	ble signal is present	t (e.g. Control			
	Terminals 1 & 2 are linked together), regardless of	of the setting of P2-3	37. If P2-37 > = 4. th	e drive will start wh	ien the link is			
	closed between terminals 1 & 2, and will not requ	uire the keypad star	t button to be press	sed. If P2-37 < 4. the	e Start Button			
	must be pressed to operate the drive after the lin	nk is closed between	terminals 1 & 2.	, , , , , , , , , , , , , , , , , , , ,				
	2) The motor direction of rotation may still be conti	rolled by signals app	lied to the digital in	puts, dependent on	the setting of			
	P1-13, e.g. the motor can still be controlled in bo	th forward and reve	rse directions if req	uired, however the	Reverse direction			
	function of the Start key is disabled.							
	3) When operating in this mode and utilising a setti	ng of P1-13 that allo	ws preset speeds to	o be also selected fr	om the drive			
	digital inputs, setting a negative value in the pres	set speed parameter	will cause the drive	e to reverse the dire	ection of motor			
	rotation.							
P1-13	Digital Inputs Function Select	0	21	1	-			
	Defines the function of the digital inputs depending on the	control mode settir	ng in P1-12.					
P1-14	Extended Menu Access Code	0	30000	0	-			
	Parameter Access Control. The following settings are applied	cable :	_					
	P1-14 = P2-40 (Factory Setting = 101) : Allows access to Par	rameter Groups 0 – !	5					
	P1-14 = P6-30 (Factory Setting = 201) : Allows Access to all	drive parameters

P2-21	Display Scaling Factor	-30.000	30.000	0.000	-	
P2-22	Display Scaling Source	0	3	0	-	
	P2-21 & P2-22 allow the user to program the Optidrive to c	lisplay an alternativ	e output unit scaled	from an existing pa	arameter, e.g. to	
	display conveyer speed in metres per second based on the	output frequency.	This function is disal	oled if P2-21 is set to	0. st the drive is	
	If P2-21 is set >0, the variable selected in P2-22 is multiplie running. The display will show a (r) on the left hand side to	d by the factor ente	red in P2-21, and ca	in be displayed whit	st the drive is	
	P2-22 Setting Options :-		ner scaled units.			
	0 : Motor Speed					
	1 : Motor Current					
	2 : Analog Input 2					
D2 22	3 : P0-80 Value	0.0	60.0	0.2	Soconds	
F 2-23	Determines the time for which the drive output frequency	is held at zero wher	stopping before t	ne drive output is di	sabled This can	
	be utilised to ensure the motor has come to a complete sta	andstill before the d	rive switches off, or	to allow time for a	holding brake to	
	engage. It is not intended to provide a continuous output h	olding torque for p	rolonged periods.		Ū	
P2-24	Effective Switching Frequency		See Below		kHz	
	Effective power stage switching frequency. The range of se	ttings available and	factory default para	ameter setting depe	nd on the drive	
	power and voltage rating, refer to section Error! Reference	e source not found.	Higher frequencies	reduce the audible	'ringing' noise	
D2 25	For the motor, and improve the output current waveform	, at the expense of I		losses.	Soconds	
P2-23	This parameter allows an alternative deceleration ramp do	wn time to be progr	240.0	utidrive which can h	selected by	
	digital inputs (dependent on the setting of P1-13) or select	ed automatically in	the case of a mains	power loss if P2-38	= 2.	
	When set to 0.00, the drive output will be immediately disa	abled, and the load	will coast to stop.	,		
			-			

Par.	Name	Minimum	Maximum	Default	Units		
P2-26	Spin Start Enable	0	2	1	-		
	0 : Disabled						
	1: Enabled. When enabled, on start up the drive will attempt to determine if the motor is already rotating, and will begin to control						
	the motor from its current speed. This can be useful for high inertia loads, or fans which may spin due to air movement even when the						
	drive is not enabled. A short delay may be observed when starting motors which are not already rotating. The spin start will detect the						
	motor direction of rotation, and will automatically operate and control the motor from that point, including reversing the direction of						
	motor rotation where required.						
	2: Enabled on Fault, Brown Out or Coast. As setting one, however the Spin Start function activates only following any event that may						
	have caused an uncontrolled stop of the motor previously.						
	Note						
	The Spin Start function cannot detect motors which are rot	ating at speeds above	ve the maximum sp	eed limit paramete	r (P1-01) setting		
DO 07	of the drive.		250.0	20.0			
P2-27	Standby Mode Timer	0.0	250.0	20.0	Seconds		
	This parameter defines time period, whereby if the drive of	perates continuously	y at the frequency /	speed set in P3-14	(Standby speed		
	threshold) for at least the set time period, the Optidrive ou	tput will be disabled	d, and the display w	ill show 5Endby . Th	ne function is		
	disabled if $P2-27 = 0.0$.						
	If the speed demand rises above minimum, the drive will in	nmediately restart a	utomatically.	•			
P2-28	Slave Speed Scaling Control	0	3	0	-		
	Active in Slave mode (P1-12=5) only. The Master speed refe	erence can be multip	plied by a preset sca	aling factor or adjus	ted using an		
	analog trim or offset.						
	U: Disabled. No scaling or offset is applied.						
	1 : Actual Speed = Master Speed x P2-29	1 Defenses Analas	Janut 1 Full Casta 1	00.0% 01.01

	Scales the analog input by this factor. See parameter descri	iption below for furt	her information.				
P2-35	Analog Input 2 Offset	-500.0	500.0	0.0	%		
	Sets an offset, as a percentage of the full scale range of the	input, which is app	lied to the analog ir	put signal			
	Analog Input Scaling and Offset are applied to the Analog Ir	nput Signal as follow	/S :-				
	Result (%) = (Analog Input Level (%) – Analog Input Offset (%)) x Analog Input S	caling (%)				
	The resultant value for Analog Input 2 can be displayed in P	0-02.					
	E.g. If the analog Input Signal format is 0 – 10 Volts, Offset	= 20.0%, Scaling = 50	0.0%				
	An analog input signal level of 7 Volts gives the following re	esult :-					
	Analog Input Level (%) = 7 / 10 = 70.0%						
	Result = (70.0 – 20.0)% X 50.0%) = 25.0%						

	Optionive Eco Advanc	ed User Guide Revi	sion 1.00				
Par.	Name	Minimum	Maximum	Default	Units		
P2-36	Start Mode Select / Automatic Restart	-	-	AULo-0	-		
	Defines the behaviour of the drive relating to the enable di	gital input and also	configures the Auto	matic Restart funct	tion.		
	Edge-r : Following Power on or reset, the drive will not sta	art if Digital Input 1	remains closed. The	Input must be clos	ed after a power		
on or reset to start the drive (e.g. Edge Triggered).							
	RULD-D: Following a Power On or Reset, the drive will auto	gital Input 1 is close	d before power on.				
	AULo- I to AULo-5 : Following a trip, the drive will make up	o to 5 attempts to re	estart at intervals de	efined by P6-03 (def	fault 20 seconds).		
	The drive must be powered down or reset manually to reset the counter. The numbers of restart attempts are counted, and if						
	drive fails to start on the final attempt, the drive will fault v	with, and will requir	e the user to manua	ally reset the fault.			
P2-37	Keypad Mode Restart Speed	0	7	2	-		
	This parameter controls the starting behaviour of the drive	when operating in	Keypad Mode (P1-1	2 = 1 or 2). Settings	0 to 3 are active		
	in Keypad Mode only (P1-12 = 1 or 2), and define the speed	d at which the drive	will initially operate	e following the pres	sing of the keypad		
	Start button.						
	0: Minimum Speed, Keypad Start. Following a stop and re	start, the drive will	always initially run a	at the minimum spe	ed set in P1-02.		
	This applies even if the drive is re-enabled whilst still decel	erating the motor fi	rom the previous sto	op command.			
	1 : Previous Operating Speed, Keypad Start . Following a st	op and restart, the	drive will return to i	the last keypad setp	point speed used		
	prior to stopping.				al as a da la c		
	2 : Current Running Speed . Where the Optiarive is configu	red for multiple spe	ed references, whe	n switched to keypa	ad mode by a		
	between automatic and manual operating modes of the dr	ivo og typically Ha	s setting can be use	r local / Pomoto co	angeover		
	3 : Preset Sneed 4 Keynad Start Following a stop and rest	art the Ontidrive w	ill always initially ru	n at Preset Speed A	(P2_04)		
	4 : Minimum Sneed Terminal Start Following a stop and rest	estart the drive wi	Il always initially run	at the minimum sr	red P1-02 The		
	drive starting is controlled from the digital inputs based or	the setting of P1-1	3				
	5 : Previous Operating Speed. Terminal Start. Following a	stop and restart. the	e drive will return to	the last keypad set	tpoint speed used		
	prior to stopping. The drive starting is controlled from the	digital inputs, based	l on the setting of P	1-13.			
	6 : Current Running Speed, Terminal Start. Where the Opt	idrive is configured	for multiple speed r	eferences (typically	/ Hand / Auto		
	control or Local / Remote control), when switched to keypa	ad mode by a digita	l input, the drive wil	I continue to opera	te at the last		
	operating speed. The drive starting is controlled from the d	ligital inputs, based	on the setting of P1	-13.			
	7: Preset Speed 4, Terminal Start. Following a stop and res	start, the Optidrive	will always initially i	run at Preset Speed	4 (P2-04). The		
	drive starting is controlled from the digital inputs, based or	the setting of P1-1	.3.				
P2-38	Mains Loss Ride Through / Stop Control	0	3	0	-		
	Controls the behaviour of the drive in response to a loss of	mains power suppl	y whilst the drive is	enabled.			
	0: Mains Loss Ride Through. The Optidrive will attempt to	continue operating	by recovering energ	gy from the load mo	otor.		
	Providing that the mains loss period is short, and sufficient	energy can be reco	vered before the dr	ive control electron	iics power		
	off, the drive will automatically restart on return of mains p	power					
	1: Coast To Stop. The Optidrive will immediately disable th	e output to the mot	tor, allowing the loa	d to coast or free w	heel. When		
	using this setting with high inertia loads, the Spin Start fund	ction (P2-26) may n	eed to be enabled				
	2: Fast Ramp To Stop. The drive will ramp to stop at the ra	te programmed in t	he Fast deceleration	n time P2-25	DC D		
	3: DC Bus Power Supply Mode. This mode is intended to be	e usea when the ar	ive is powered direc	tty via the +DC and	-DC BUS		
D2 20	Connections. Refer to your invertex sales Partner for furthe		1	0

	1: Locked Parameter values can be displayed but cannot	he changed					
D2 40	Evtended Darameter Access Code Definition		0000	101			
P2-40	Defines the access and which must be entered in D1 14 to			101	-		

Par.	Name	Minimum	Maximum	Default	Units
P3-01	PID Proportional Gain	0.1	30.0	1.0	-
	PID Controller Proportional Gain. Higher values provide a g	reater change in the	e drive output frequ	ency in response to	small changes in
	the feedback signal. Too high a value can cause instability	-			-
P3-02	PID Integral Time Constant	0.0	30.0	1.0	Seconds
	PID Controller Integral Time. Larger values provide a more	damped response fo	or systems where th	e overall process re	sponds slowly
P3-03	PID Differential Time Constant	0.00	1.00	0.00	Seconds
	PID Differential Time Constant				
P3-04	PID Operating Mode	0	1	0	-
	0 : Direct Operation . Use this mode if an increase in the mo	ntor speed should re	esult in an increase	in the feedback sign	al
	1: Inverse Operation. Use this mode if an increase in the m	notor speed should	result in a decrease	in the feedback sig	nal
P3-05	PID Reference (Setpoint) Source Select	0	2	0	-
	Selects the source for the PID Reference / Setpoint	Ŭ		Ŭ	
	0 : Digital Preset Setnoint P3-06 is used				
	1 : Analog Input 1 Setpoint				
	2 : Analog Input 2 Setpoint				
P3-06	PID Digital Reference (Setpoint)	0.0	100.0	0.0	%
	When $P3-05 = 0$ this parameter sets the preset digital refe	rence (setnoint) use	d for the PID Contro	oller	70
P3-07	PID Controller Output Upper Limit	P3-08	100.0	100.0	%
1307	Limits the maximum value output from the PID controller	15 00	100.0	100.0	70
D3-08	PID Controller Output Lower Limit	0.0	P3_07	0.0	%
F 3-00	Limits the minimum output from the BID controller	0.0	F 5 -07	0.0	70
D2 00	PID Output Limit Control	0	2	0	
P3-09	PID Output Limit Control	U Vallaria limitad buth			-
	U: Digital Output Limits . The output range of the PID contr	foller is limited by th	1e values of P3-U7 &	ι P3-U8 ad hysthe velues of I	D2 00 8 the signal
	1: Analog input 1 provides a variable Opper Limit. The ou	tput range of the Pi	D controller is limite	ed by the values of l	23-08 & the signal
	Applied to Analog Input 1	itaut range of the D	ID controllor is limit	ad by the signal and	aliad to Analog
	2. Analog input 1 Provides a variable Lower Linit. The of	itput range of the P		eu by the signal app	Jieu to Analog
	3 · PID output Added to Analog Input 1 Value. The output	value from the PID (Controller is added	to the sneed refere	nce annlied to the
	Analog Input 1	value from the rib		to the spectre left	the upplied to the
P3-10	PID Feedback Signal Source Select	0	5	0	-
	0 : Analog Input 2	Ŭ	5	Ŭ	
	1 : Analog Input 1				
	2 : Motor Current . The feedback value is scaled such that 1	00.0% = P1-08			
	3 : DC bus voltage . The feedback is scaled such that 100.0%	6 = 1000 Volts			
	4 : Differential : Analog input 1 – Analog input 2. PID Feed	back = P0-01 - P0-0	2. limited to 0.0 mir	nimum value	
	5 : Largest Value : Analog Input 1 or Analog Input 2.		_,		
P3-11	Maximum PID Error to Enable Ramps	0.0	25.0	0.0	%
	Defines a threshold PID error level, whereby if the difference	ce between the setr	point and feedback	values is less than t	ne set threshold.
	the internal ramp times of the drive are disabled. Where a	greater PID error ex	ists, the ramp times	s are enabled to lim	it the rate of
	change of motor speed on large PID errors, and react quick	ly to small errors.	<i>,</i> ,		
	Setting to 0.0 means that the drive ramps are always enabl	, ed. This parameter i	is intended to allow	the user to disable	the drive internal
	ramps where a fast reaction to the PID control is required,	however by only dis	abling the ramps w	hen a small PID erro	or exists, the risk
	of possible over current or over voltage trips being generat	ed are reduced.	0 1		
P3-12	PID Feedback Value Display Scaling Factor	0.000	50.000	0.000	-
	Applies a scaling factor to the displayed PID feedback, allow	ving the user to disp	lay the actual signa	l level from a transo	ducer, e.g. 0 – 10
	Bar etc. The value is displayed with an 'r' prefix, to one dec	imal place.	, 0		
P3-13	PID Error Wake Up Level	0.0	100.0	5.0	%
	Sets a programmable level whereby if the drive enters stan	dby motor whilst or	perating under PID o	control. the differer	ice between the
	setpoint and the selected feedback signal increase beyond	this threshold befor	re the drive will retu	irn to normal opera	tion.
P3-18	PID Reset Control	0	1	0	-
	This parameter is used to control the reset behaviour of the	e PID controller	-	-	
	0 : Continuous Run . In this mode, the PID controller operat	es continuously reg	ardless of the oper	ating state of the d	rive. This can
	result in the output of the PID controller integrating up to t	he maximum limit r	prior to the drive he	ing enabled.	
	1 : Reset On Disable . In this mode, the PID controller output	it is reset to zero wi	nen the drive is disa	bled, and restarts w	when the drive is
	enabled.				

1.3.4.	Parameter Gro	up 4 – High Performance Motor Cont	rol					
Par.	Name		Minimum	Maximum	Default	Units		
	Incorrect adjust	ment of parameters in menu group 4 can	cause unexpected	behaviour of the m	otor and any conne	ected machinery.		
∕!∖	-	It is recommended that these pa	rameters are only a	adjusted by experie	nced users.	-		
P4-01	Motor Control M	ode	0	5	0	-		
	Selects the motor	control method. An autotune should be r	performed for all m	odes but is mandate	ory for modes 2 - 5.			
	0: Eco Vector Speed Control (VT). Suitable for use with AC induction motors with a variable torque load such as centrifugal fans or							
	pumps where the voltage to frequency characteristic follows a quadratic relationship.							
	1: Eco Vector Speed Control (CT). Suitable for use with AC induction motors with a constant torque load such as blowers or positive							
	displacement pumps where the voltage to frequency characteristic follows a linear relationship.							
	2: IM Vector Speed Control. Similar to mode 1 but requires more accurate motor information including motor power factor P4-05.							
	3 : PM Motor Vector Speed Control. Equivalent to setting 1, but intended for operation of Permanent Magnet motors.							
	4 : BLDC Motor S	peed Control. For operation of Brushless I	C Motors.					
	5 : SynRel Motor	Speed Control. For operation of Synchron	ous Reluctance Mo	otors.				
P4-02	Motor Parameter	r Auto-tune Enable	0	1	0	-		
	When set to 1, th	e drive immediately carries out an autotu	ne to measure the r	notor parameters for	or optimum control	and efficiency.		
	Following comple	tion of the autotune, the parameter autor	matically returns to	0.				
	Note		, i a construction of the second s					
	All motor namepl	ate data should be programmed into the o	drive, e.g. P1-07, P1	L-08, P1-09 and P4-0)5 prior to starting t	he autotune		
		Whilst the autotune does not require t	he motor to rotate	, it may still cause s	ome movement of	the motor shaft,		
	Δ	thereby it is important to ensure that t	he motor and load	are safe to operate	prior to starting th	e autotune.		
		The autotune does <u>not</u> require the load	d to be removed fro	om the motor, how	ever the motor brai	ce should be		
	<u> </u>	released providing it is safe to do so. Th	ne motor must be s	tationary during th	e auto-tune proced	ure, if the motor		
		is rotating then the auto-tune will fail o	or incorrect motor (data will be measur	ed by the drive.			
P4-03	Vector Speed Cor	ntroller Proportional Gain	0.1	400.0	50.0	%		
	Sets the proportion	onal gain value for the speed controller wh	nen operating in Ve	ctor Speed or Vecto	r Torque motor cor	trol modes (P4-		
	01 = 0 or 1). High	er values provide better output frequency	regulation and res	ponse. Too high a va	alue can cause the s	peed to		
	overshoot the set	point during acceleration, and may also ca	ause speed instabili	ty and possibly over	r current trips. For a	pplications		
	requiring best pos	ssible performance, the value should be a	djusted to suit the c	connected load by g	radually increasing f	the value and		
	monitoring the ac	ctual output speed of the load until the red	quired dynamic beh	aviour is achieved w	with little or no over	shoot of the		
	target speed duri	ng acceleration and deceleration.						
	In general, higher	friction loads can tolerate higher values o	of proportional gain	, and high inertia, lo	w friction loads ma	y require the gain		
	to be reduced.							
P4-04	Vector Speed Cor	ntroller Integral Time Constant	0.010	2.000	0.050	Seconds		
	Sets the integral t	ime for the speed controller. Smaller valu	es provide a faster	response in reactior	i to motor load chai	nges, at the risk		
	of introducing ins	tability. For best dynamic performance, th	ne value should be a	adjusted to suit the	connected load.			
P4-05	Motor Power Fac	tor Cos Ø	0.00	0.99	-	-		
	When operating i	n Vector Speed or Vector Torque motor co	ontrol modes, this p	parameter must be s	set to the motor nar	neplate power		
	factor before an a	autotune is carried out.						
P4-07	Maximum Motor	ing Torque Limit	P4-08	150.0	110.0	%		
	This parameter de	efines the maximum torque limit (or curre	nt limit) of the drive	e				
P4-12	Motor Thermal M	Nemory Retention	0	1	0	-		
	0 : Disabled. The	present value of the motor overload accur	mulator is not store	d during power off.				
	1 : Enabled. The v	value of the motor thermal overload accur	nulator is stored du	iring power off.				
	Whilst the motor	is being operated, the drive continuously	monitors the outpu	it current over a tim	e period, to determ	ine the likely		
	operating temper	ature of the motor. If the motor operates	at high current for	a period of time, th	e drive may trip to r	protect the motor		
	and prevent dama	age. When this function is disabled (defau	It setting), removin	g the power supply	from the drive will r	result in the		
	thermal overload	value for the motor being reset to zero. h	ence the motor col	uld potentially be or	perated and damage	ed. By enabling		
	this parameter. ev	ven if the mains power is removed from the	ne drive, the value i	s retained, and reus	ed at the next powe	er on, in order to		
	avoid the risk of d	lamage to the motor.		,				
P4-13	Output Phase Sec	quence	0	1	0	-		
	0 : U, V, W.	•						
	1: U, W, V. Direct	tion of motor rotation when operating in a	a forward direction	will be reversed.				

1.3.5. Parameter Group 5 – Communication Parameters

Par.	Name	Minimum	Maximum	Default	Units	
P5-01	Drive Fieldbus Address	0	63	1	-	
	Sets the fieldbus address for the Optidrive					
P5-03	Modbus RTU / BACnet MSTP Baud Rate	9.6	115.2	115.2	kbps	
	Sets the baud rate when Modbus RTU / BACnet MSTP com	munications are us	sed			
P5-04	Modbus RTU /BACnet MSTP Data Format	0	3	0	-	
	Sets the expected Modbus telegram data format as follows	S				
	n- 1: No Parity, 1 stop bit					
	\mathbf{n} - \mathbf{i} : No parity, 2 stop bits					
	\mathbf{P} - 1: Odd parity 1 stop bit					
	F-1: Even parity 1 stop bit					
P5-05	Communications Loss Timeout	0.0	5.0	10	Seconds	
1 3-03	Sets the watchdog time period for the communications cha	annel for fieldbus s	vstems where the d	rive must monitor f	or loss of	
	communications with the network master e.g. Modhus RT	II If a valid telegra	is not received by	w the Ontidrive with	in this time	
	communications with the network master, e.g. Modpus KTO. If a valid telegram is not received by the Optidrive within this time period, the drive will assume a loss of communications has occurred and react as selected below. Softing to zero disables the					
	function.					
P5-06	Communications Loss Action	0	3	0	-	
	Controls the behaviour of the drive following a loss of com	munications as det	ermined by the abo	ve narameter settin)g	
	0 : Trip & Coast To Stop			ve parameter settin	.0.	
	1 : Ramp to Stop Then Trip					
	2 : Ramp to Stop Only (No Trip)					
	3 : Run at Preset Speed 4					
P5-07	Fieldbus Ramp Control	0	1	0	-	
	Selects whether the acceleration and deceleration ramps a	re control directly	via the Fieldbus. or	by internal drive pai	rameters P1-03	
	and P1-04.	,	,	, ,		
	0: Disabled. Ramps are control from internal drive parame	eters				
	1: Enabled. Ramps are controlled directly by the Fieldbus					
P5-08	Fieldbus Process Data Output Word 4 Select	0	7	1	-	
	When using an optional fieldbus interface, this parameter	configures the para	meter source for th	ie 4 th process data w	vord transferred	
	from the drive to the network master during cyclic commu	nication.		·		
	0 : Output Torque – 0 to 2000 = 0 to 200.0%					
	1: Output Power – Output power in kW to two decimal pl	aces, e.g. 400 = 4.0	0kW			
	2 : Digital Input Status – Bit 0 indicates digital input 1 statu	is, bit 1 indicates d	igital input 2 status	etc.		
	3 : Analog Input 2 Signal Level – 0 to 1000 = 0 to 100.0%					
	4 : Drive Heatsink Temperature – 0 to 100 = 0 to 100°C					
	5 : User Register 1					
	6 : User Register 2					
	7 : P0-80 Value					
P5-09	BACnet Device Instance Number (Low)	0	65535	1	-	
	Specifies the Low word of the BACnet device instance num	ber		-		
P5-10	BACnet Device Instance Number (High)	0	65535	0	-	
	Specifies the High word of the BACnet device instance num	hber		-		
P5-11	BACnet Maximum Number of Masters	0	127	127	-	
	Defines the maximum number of BACnet masters on the lo	ocal MSTP BACnet i	network			
P5-12	Fieldbus Process Data Output Word 3 Select	0	7	0	-	
	When using an optional fieldbus interface, this parameter	configures the para	ameter source for th	ie 3 rd process data w	vord transferred	
	from the drive to the network master during cyclic commu	nications				
	0 : Motor current – Output current to 1 decimal place, e.g.	100 = 10.0 Amps				
	1: Power (X.XX KW) Output power in KW to two decimal pl	aces, e.g. 400 = 4.0	JUKVV	- + -		
	2 : Digital input status – Bit 0 indicates digital input 1 statu	is, bit 1 indicates di	igital input 2 status (etc.		
	5 : Analog input 2 Signal Level - 0 to $1000 = 0$ to 100.0%					
	5 : User register 1 – User Defined Register 1 Value					
	6: User register 2 – User Defined Register 1 Value					
	7 : P0-80 value – User Selected data value – see section 0					
P5-13	Fieldbus Process Data Input Word 4 Select	0	1	0	_	
F J-13	When using an optional fieldhus interface, this parameter	configures destinat	ion for the 4 th proce	ess data word receiv	ed by the drive	
	from the network master during cyclic communications	compares aestinat			cu by the unite	
	0 : Fieldbus Ramp Control – This option must be selected i	f the drive accelera	ation and deceleration	on ramps are to be o	controlled from	
	the fieldbus. P5-07 must also be set to 1 to enable this fun	ction.				
	1 : User register 4 – The value received by the drive in PDI	4 is transferred to	User Register 4. Thi	s option allows the f	unction of the	
	process data word to be defined in Parameter Group 9. In	this case, User Reg	ister 4 should not be	e written to within a	iny Function	
	Block code, although the value can be read. Refer to section	n 1.4 for further in	formation.			

P5-14	Fieldbus Process Data Input Word 3 Select	0	2	0	-				
	When using an optional fieldbus interface, this parameter configures destination for the 3 rd process data word received by the drive								
	from the network master during cyclic communications								
	0 : Torque limit/reference – This option must be selected if the drive output torque limit / setpoint is to be controlled from the								
	fieldbus. This also requires setting P4-06 = 3.								
	1: User PID reference register – This option allows the set	point to the PID co	ntroller to be receiv	ed from the Fieldbu	ıs. In order for				
	this option to be used, P9-38 must be set to 1, and the PID	User setpoint must	not be utilised wit	hin any Function Blo	ock Code.				
	2: User register 3 - The value received by the drive in PDI	3 is transferred to L	Iser Register 3. This	option allows the f	unction of the				
	process data word to be defined in Parameter Group 9. In	this case, User Regi	ster 3 should not be	e written to within a	any Function				
	Block code, although the value can be read. Refer to section	on 1.4 for further inf	formation.						
P5-15	Modbus Response Delay	0	16	0	Chr				
	Allows the user to configure an additional delay between the drive receiving a request via the Modbus RTU interface, and								
	transmitting a reply. The value entered represents the dela	ay in addition to the	e minimum delay pe	rmissible according	to the Modbus				
	RTU specification, and is expressed as the number of additional characters.								

Par.	Name	Minimum	Maximum	Default	Units			
P6-01	Enable Firmware Upgrade	0	3	0	-			
	Enables the firmware upgrade mode, allowing the User Inte	erface firmware and	l/or the Power Stag	e Control firmware	to be upgraded.			
	Options are:							
	0 : Disabled							
	1 : Upgrade User Interface and Power Stage Control firmw	vare						
	2 : Upgrade User Interface firmware only							
	3 : Upgrade Power Stage Control firmware only							
	NOTE This representation allocated is a distant of her the linear. The firm		and in convioul cut fo		in a Ontite ala			
	Studio PC software	inware upgrade pro-	Less is carried out it	any automatically us	sing Optitoois			
P6-02	Automatic Thermal Management Minimum Switching	10	Model	10	kH7			
1002	Frequency	10	Dependent	10	KI 12			
	This parameter defines the minimum effective switching fr	equency which the	drive will use					
	During operation, the drive measures the power module te	equency which the comperature and will	switch automatical	lv to a lower switch	ing frequency if			
	the temperature reaches a pre-defined limit. This parameter	er determines the lo	west frequency that	t can be used. In th	e event that the			
	power module temperature continues to increase, the driv	e will trip on over te	emperature.					
P6-03	Auto Reset Time Delay	1	60	20	S			
	Sets the delay time which will elapse between consecutive	drive reset attempt	s when Auto Reset	is enabled in P2-36				
P6-04	User Relay Output Hysteresis Control	0.0	25.0	0.3	-			
	This parameter works in conjunction with P2-11 and P2-13	= 2 or 3 to set a bar	nd around the targe	t speed (P2-11 = 2)	or zero speed			
	(P2-11 = 3). When the speed is within this band, the drive is	s considered to be a	t target speed or Ze	ro speed. This fund	ction is used to			
	prevent "chatter" on the relay output if the operating spee	ed coincides with the	e level at which the	digital / relay outpu	t changes state.			
	e.g. if P2-13 = 3, P1-01 = 50Hz and P6-04 = 5%, the relay co	ntacts close above 2	2.5Hz					
P6-08	Maximum Speed Reference Frequency	0	20	0	kHz			
	When the motor speed reference is to be controlled by a fr	requency input signa	al (connected to Dig	ital input 3), this pa	rameter is used			
	to define the input frequency which corresponds to the ma	aximum motor speed	d (set in P1-01). Thi	s maximum frequer	ncy that can be			
	set in this parameter must be in the range 5kHz to 20kHz.							
DC 40	when set to 0, this function is disabled.	0	4	0				
P6-10	Enable Function Block Program Operation	0	1	0	-			
	0 : Function Block Program Disabled.	a cat ta 1 ta anabla	any Eurotian Plack	Brogram loaded int	a tha driva ta			
	1. Function block Figran Enabled. This parameter must be operate When set to 0, the Eulerian Block Program will be		any function block	Program loaded int	o the unve to			
D6-11	Speed Holding Time on Enable		250	0	c			
10-11	Defines a time period for which the drive will run at Preset	Speed 7 (P2-07) wh	en the Enable signa	l is applied to the d	rive. The preset			
	speed can be any value from minimum to maximum freque	ency and in either di	rection. This function	on can be useful in a	pplications			
	requiring controlled start-up behaviour regardless of the no	ormal system opera	tion, and allows the	user to program th	e drive to always			
	start at the same frequency, with the same direction of rot	ation for a specified	time period before	returning to norma	, al operation.			
	This function can be used with pumps to provide a reverse	spin on start-up to	clear any potential b	olockages.				
P6-12	Speed Holding / DC Injection Time on Disable	0	250	0	S			
	When P6-18 = 0, defines a time period for which the drive	will run at Preset Sp	eed 8 (P2-08) follov	ving removal of the	Enable signal,			
	before ramping to stop.							
	Note							
	Setting this parameter > 0 will result in the drive continuing	g to operate for the	set time at the pres	et speed <u>after</u> the e	enable signal has			
DC 19	DC Injection Broking Current			0.0	0/			
F0-10	Defines the DC current level as a percentage of motor rate	d current (P1-08) th	100.0 at is applied to the r	0.0 motor when a ston	⁷⁰			
	received and the DC Injection function is activated		at is applied to the i	notor when a stop				
P6-22	Cooling Fan Runtime Counter Reset	0	1	0	-			
	0 : No Function	Ŭ	-	Ŭ				
	1 : Reset . Setting to 1 resets the internal Fan run-time cour	nter to zero (as displ	aved in Index 1 of P	0-35).				
P6-23	Energy Consumption (kWh) Meter Reset	0	1	0	-			
	0 : No Function							
	1: Reset . Setting to 1 resets internal kWh meter to zero (a	is displayed in Index	1 of PO-26 and Inde	ex 1 of PO-27).				
P6-24	Maintenance Time Interval	0	60000	0	Hours			
	Allows the user to define a maintenance interval period for	r the application. Th	is defines the total i	number of run time	hours which			
	must elapse before the service indicator is displayed. This r	may be viewed on th	ne drive OLED displa	iy, may be program	med to a relay			
	output, and also sets a bit in the drive status word.							
	When P6-25 is set to 1, the internal service interval counte	r is set to this value						
P6-25	Maintenance Time Reset	0	1	0	-			
	When this parameter is set to 1, the internal service interva	al counter is set to t	he value defined in	P6-24				
P6-26	Analog Output 1 Scaling	0.0	500.0	100.0	%			
	Defines the scaling factor as a % used for Analog Output 1							
P6-27	Analog Output 1 Offset	-500.0	500.0	0.0	%			
	Defines the offset as a % used for Analog Output 1							

Optidrive Eco Advanced User Guide Revision 1.00

Par.	Name	Minimum	Maximum	Default	Units			
P6-28	P0-80 Display Value Index	0	200	0	-			
	This parameter defines the index of the internal variable, t	he value of which w	vill be displayed in P	0-80.				
	This is usually used in conjunction with the Function Block	Program. Refer to s	ection 1.6 for furthe	er information.				
P6-29	Save User Parameters as Default	0	2	0	-			
	0 : No Function							
	1: Save Parameters. Setting this parameter to 1 saves the	present drive parar	neter settings to the	e User Default Parar	neters Memory.			
	Following this, if the User carries out a 3-button default pa	arameter command	(UP, DOWN and ST	OP), the parameter s	aved at this time			
	will be restored.							
	2: Erase Parameters. Setting 2 clears the User Default Par	ameters Memory.						
P6-30	Advanced Parameter Access Code Definition	0	9999	201	-			
	Defines the access code which must be entered into P1-14	to allow access to t	he Advanced Paran	neters.				
137	Parameter Group 7 – Motor Data							
<u> </u>	The following parameters are used internally by the drive	to provide optimur	m nossible motor c	ontrol Incorrect set	ting of the			
	parameters can result in noor performance and unexpect	ed behaviour of the	motor Adjustmen	its should only be ca	arried out by			
<u>··</u>	experienced users who fully understand the functions of t	the narameters	motor: Aujustmen		incu out by			
Par	Name	Minimum	Maximum	Default	Units			
P7-01	Motor Stator Resistance (Rs)	-	-	Default	Ohms			
17-01	Motor stator resistance value measured during the autotu	l ne			Olinis			
P7_03	Motor Stator Inductance (Ltd)	-	-	_	Ц			
17-05	For induction motors: phase stator inductance value				11			
	For nermanent magnet motors: phase d-axis stator inducta	ance in Henry (H)						
P7-04	Motor Magnetising Current (Id rms)		-	-	Δ			
F7-04	For induction motors: magnetizing / no load current Befor	Auto-tune this va	lue is annrovimated	to 60% of motor ra	ted current (P1-			
	(10) model in the form in t	e Auto-tune, this va						
P7-05	Motor Leakage Coefficient (Sigma)	-	-	-	-			
F7-05	For induction motors: motor leakage inductance coefficien	+	-	_				
D7 06	Motor Stator Industance : BM Motors (Lsa)							
F7-00	For permanent magnet motors: phase d-axis stator inducta	nce in Henry (H)	-	_				
D7_00	Over Voltage Current Limit		100.0	5.0	0/			
F7-05	Effective in vector speed central mode only, and will come	into function onco t	the drive DC bus vel	5.0	70			
	This voltage limit is set internally just below the over voltage	The trip lovel. This part	ramatar will affectiv	volv limit the output	torquo curront			
	in order to prevent a large current flowing back to the driv	e which may cause	an Over-voltage tri	A small value in th	is narameter will			
	limit the motor control torque when the drive DC bus volta	age exceeds the nres	et limit A higher va	alue may cause a sig	nificant			
	distortion in the motor current, which may cause an aggree	ssive, rough motor h	ehaviour.	and may cause a sig				
P7-10	System Inertia Constant	0	600	10	-			
	System Load Inertia to Motor Inertia Ratio entered as H = (JTot / JMot). This va	lue can normally be	e left at the default v	alue (10) and is			
	used by the drive control algorithms as a feed-forward con	trol variable to prov	ide optimum torqu	e current to accelera	ate the load.			
	Hence accurate setting of the inertia ratio will produce a be	etter system respon	se and dynamic beh	naviour.				
P7-11	Pulse Width Minimum Limit	0	500	-	-			
	This parameter is used to limit the minimum output pulse	width. which can be	used for long moto	r cable applications.	Increasing the			
	value of this parameter will reduce the risk of over-current	trips, but will also r	educe the maximur	n available output m	notor voltage.			
P7-12	Magnetising Period	0	5000	-	ms			
	Defines the delay time between the output stage enabling	at 0.0Hz prior to the	e output frequency	beginning to ramp to	o accelerate the			
	motor. This allows time for the motor to correctly magnetise, and avoids possible over current trins that may occur if the output							
	frequency begins to ramp before the motor flux has stabilis	sed.			·			
P7-14	Low Frequency Torque Boost	0.0	100.0	0.0	%			
	Effective in all motor control modes, except V/F mode (P4-	01 = 2), but primaril	y intended for use	with synchronous m	otors.			
	Allows a boost current to be applied at start-up and low frequency (limit defined by P7-15), as a percentage of the motor rated current							
	(P1-08). Injecting some additional current into the motor a	t low speed helps to	ensure that the ro	tor alignment is mai	ntained,			
	imrpoving operation of the motor at lower speeds.							
	In order to determine the correct setting, run the drive at t	he lowest frequency	y required by the ap	plication and increa	ise boost levels			
	to provide both required torque and smooth operation wh	ilst avoiding excessi	ve current levels wh	nich may cause nuisa	ance tripping.			
P7-15	Torque Boost Frequency Limit	0.0	50.0	0.0	%			
	Frequency range for applied boost current (P7-14) as a % o	of motor rated frequ	ency (P1-09). This s	ets the frequency cu	it-off point above			
	which boost current is no longer applied to the motor.							
P7-18	Over Modulation Enable	0	1	0	-			
	0: Disabled							
	1: Enabled. When enabled, over modulation provides a sm	nall increase in the a	vailable output volt	age from the drive,	which can assist			
	in applications where the supply voltage is too low to prov	ide the required mo	tor voltage, resultin	g in an increased m	otor current.			
P7-19	BLDC Light Load Optimisation	0	1	0	-			
	0: Disabled							
	1: Enabled. When enabled and the drive is set in BLDC Mo	de (P4-01 = 4), the c	drive will reduce the	e output voltage dur	ing loght load			
	operation in order to improve motor efficiency and perform	mance. This setting	has no effect when	the motor is signific	antly loaded.			

1.3.8. Parameter Group 8 – Application Specific Parameters

Par.	Name	Minimum	Maximum	Default	Units
P8-01	Stir Interval Duration	0	60000	0	S
	This parameter can be used to set a pre-defined period of i	nactivity, whereby i	f the drive remains	in standby mode fo	r a period of time
	exceeding the limit, stir function is activated, and the drive	will operate at pres	et speed 7 (P2-07) 1	for the time set in P	8-02. This allows
DO 03	the pump to stir, preventing sediment from settling and av	oiding a blockage.	6000	10	-
P8-02	Pump Stir Activation Time	1 tuises and (such add	6000	10	S
D9 02	Set the time period that the stir function will be active once	e triggered (exclude	s time for decelerat	ion to stop)	
F0-03	This parameter configures the drive conditions that will cal	use activation of the	automatic numn cl	ean function. When	activated the
	pump clean will operate the pump at preset speed 5 (P2-05	5) for the time perio	d set in P8-04. follo	wed by Preset Spee	d 6 (P2- 06)
	(Providing P2-06 <> 0) for the time set in P8-04, before resu	uming normal opera	tion. During the cle	aning cycle, the ran	np time set in P8-
	05 is used for both acceleration and deceleration, and over	rides P1-03 and P1-	04.	0, 1	
	Where possible, P2-05 and P2-06 may be set to negative va	lues, to allow the p	ump to be reversed	. For best results, it	is recommended
	to use as high a speed as possible, and to adjust P8-05 to a	llow a short accelera	ation time whilst av	oiding over current	trips.
	0 : Disabled	4 4 4 -			
	1: Active on start-up only. The pump cleaning function op	erates every time th	e pump is started.	o tho nump is starts	d and also in the
	2: Active on start-up and over-torque detection. The pum event that the drive detects a possible numb blockage duri	p cleaning function	This requires the	e the pump is starte Load Profile Monito	ring function to
	be active and commissioned for correct operation, see para	ameter P8-06.	i. This requires the		
	3 : Active on over-torgue detection only. The pump cleaning	ng function operate	s only when a possi	ble pump blockage	is detected
	during normal operation. This requires the Load Profile Mo	nitoring function to	be active and comr	nissioned for correc	t operation, see
	parameter P8-06. Note: The pump clean function can also l	pe activated by digit	al input configured	in group 9 paramet	ers
P8-04	Pump Cleaning Time	0	600	0	S
	Sets the time period for the operation of the pump cleaning	g cycle. When bi-dir	ectional pump clear	ning is selected, the	time interval is
D0.05	used twice, once in each direction.	0.0	6000	20	-
P8-05	Independent ramp rate used only for the nump automatic	U.U	0000 00 P8-03) when the	30 motor is Accelerate	s ad as part of
	the cleaning cycle.		ee F8-03) when the	motor is Accelerate	u as part of
P8-06	Load Monitor Enable	0	3	0	-
	This parameter enables the Load Profile Monitoring Function	on (load current mo	nitoring), which can	be used to detect l	pelt failure in belt
	driven fan applications, or Dry Pump, Pump Blockage or bro	oken impeller in Pur	np applications.		
	0: Disabled				
	1: Low Load Detection Enabled (Belt Failure / Dry Pump / E	Broken Impeller)			
	2: High Load Detection Enabled (Pump Blockage)				
	4: Low and High Load Detection warning only - bit 7 of the	status word goes h	ligh in the event of :	a high or low load h	eing detected
	but the drive will not trip				
	Adjustment of parameter P8-06 (<>0) will cause the drive	to automatically ru	n the motor throug	h its programmed	frequency
∠•́`\	range upon the next drive enable (input enable). Ensure the	ne application is in a	a suitable condition	to allow the moto	r to run
P8-07	Load Profile Bandwidth	0.1	50.0	1.0	А
	This parameter sets a bandwidth around the Load profile g	enerated by P8-06.	If P8-06 has been se	et to an appropriate	value to
	detect an over /under load condition and the drive operate	s outside of the bar	ndwidth set in P8-07	for a period longer	^r than that
	defined by P8-08 then the drive will trip. Value entered in F	8-07 is the value be	etween the normal of	current and the trip	level, hence
	total bandwidth for the function is 2 x P8-07.				
P8-08	Load Monitor Trip Delay	0	60	0	S
	This parameter sets a time limit for the Load profile genera	ted by P8-06. If P8-0	U6 has been set to a	in appropriate value	to detect an
	DVer / under load condition and the drive operates outside	of the bandwidth se	et in P8-07 for a peri	lod longer than that	defined by
P8-09	Fire Mode Logic	0	1	0	-
	When Fire mode is assigned to a digital input on the drive t	hen the logic config	uration for the inpu	it is set by P8-09 to	allow
	normally open or normally closed activation. Default behav	iour is for Input log	ic off (0) to activate	fire mode (Open ac	tivation).
	Input configuration for Fire mode is set by parameter P1-13	3 or can be user def	ined by the setting o	of P9-32.	
	0 : Open Activation				
	1 : Closed Activation				
P8-10	Fire Mode Speed	-P1-01	P1-01	0	Hz
	When set to a non-zero value, this parameter sets an opera	ational fixed frequer	ncy / speed used wh	ien Fire Mode is sel	ected. The
	drive will maintain operation at this frequency until the fire	e mode signal is rem	oved or the drive is	no longer able to s	ustain
	When P8-10 is zero, and fire mode is activated the drive w	ill continue to opera	ate under the contro	of the selected sn	heed
	reference, dependent on parameter settings and digital inc	out selection.		of of the selected sp	ccu
P8-11	Bypass Mode on Fault	0	1	0	-
	Parameter configures the drive to switch to bypass mode a	utomatically should	a trip occur on the	drive. When enable	d the drive
	standard relays 1 and 2 are dedicated to bypass control and	d cannot be assigne	d other functions.		
	0 : Disabled				
	1 : Enabled				

		•							
P8-12	Bypass Mode on Fire	0	1	0	-				
	Parameter configures the drive to switch to bypass mode automatically should an input to the drive be configured for Fire Mode								
	operation and that input becomes active, when enabled the drive standard relays 1 and 2 are dedicated to bypass control and								
	cannot be assigned other functions.								
	0 = Disabled								
	1 = Enabled								
P8-13	Bypass Contactor Changeover Time	0	30	2	S				
	Parameter active when Bypass function is enabled. Parame	ter P8-05 sets a tim	e delay or changeov	ver time between th	e switching				
	of the drive relays controlling the bypass circuitry.								
	Care must be taken when setting P8-13 to ensure that driv	e and DOL contact	ors are not switche	d in circuit simultar	neously.				
/! \	Both Mechanical and Electrical interlocking of drive and D	OL contactors to re	gional standards ar	e recommended in	configuring				
	the Bypass function								
P8-14	Pump Staging Function Select	0	4	0	-				
	Parameter enables the pump staging (cascade) function on	the drive							
	0 : Disabled								
	1 : Single VFD with DOL Cascade (max 4 DOL pumps)								
	2 : Multiple Drive Cascade (Optiflow) Master Drive (Only V	alid when drive set	to Optibus master	address, P5-01 = 1)					
	3 : Multiple Drive Cascade with Jockey Pump (Optiflow) M	laster Drive (Only va	alid when drive set	to Optibus master	address, P5-				
	01 = 1) In this instance, the Master drive (with address P5-0)1 =1) will remain ac	tive and will not be	switched off to sup	port the				
	pump rotation ordinarily used for the purpose of sharing of	berating hours acros	s all pumps.						
	4 : Multiple Drive Cascade Mode 2 (Optiflow) Master Drive	e (Only valid when	drive set to Optibus	master address, P	5-01 = 1) This				
	mode is similar to mode 2 but the settling time works differ	rently which can pre	event multiple moto	rs starting simultan	eously when				
	waking up from PID Standby mode	4		4					
P8-15	Number of Assist Pumps	1	4	1	-

P0-20. P8-20 provides the master reset to all run time clocks used for Pump Staging Function (all clocks set to

1.4. Parameter Group 9 – Programmable Logic Functions

Parameter Group 9 is intended to allow the user complete flexibility to control the behaviour of the drive in more complex applications which require specialised parameter settings to accomplish. The parameters contained within this group should be used carefully, and the user should ensure they are fully familiar with the operation of the drive and its control functions prior to making any adjustment to parameters contained within this group.

1.4.1. Parameter Group 9 Function Overview

Parameter Group 9 allows advanced programming of the drive, including user defined functions for the digital and analog inputs of the drive and control of the speed reference source.

Group 9 Consists of three types of parameters

Logic Source Selection	These can be used to select the source for programmable Digital signals internally within the drive
Data Source Selection	These can be used to select the source for programmable Analog signal sources within the drive
Function Enable Parameters	These are used to select whether drive functions are controlled by their usual parameter selection, or have
	user defined behaviour (e.g. controlled by a Function Block Program within the drive written by the user).

The following rules apply to parameter Group 9.

- Parameters P9-01 to P9-32 inclusive may only be changed when P1-13 = 0
- When the value of P1-13 is changed, all previous settings in Parameter Group 9 will be cleared, and new settings entered based on the P1-13 selection.

1.4.2. Logic Source Selection Parameters

Logic Source Selection parameters allow the user to directly define the source for a control function within the drive. These parameters can only be linked to digital values, which either enable or disable the function depending on their state.

No.	Drive LED	Drive OLED	Function
	Display	Display	
0	DFF / SAFE	Off / Safe	Function permanently disabled, or where allowed, linked to the status of the STO inputs
1	din-l	Digital Input 1	Function linked to Digital Input 1 Status
2	d in-2	Digital Input 2	Function linked to Digital Input 2 Status
3	E-ni b	Digital Input 3	Function linked to Digital Input 3 Status
4	d in-Y	Digital Input 4	Function linked to Digital Input 4 (Analog Input 1) Status
5	d m-5	Digital Input 5	Function linked to Digital Input 5 (Analog input 2) Status
6	d in-6	Digital Input 6	Function linked to Digital Input 6 Status (Requires Extended I/O option)
7	ם יט- ב	Digital Input 7	Function linked to Digital Input 7 Status (Requires Extended I/O option)
8	d in-8	Digital Input 8	Function linked to Digital Input 8 Status (Requires Extended I/O option)
9	AoUE- I	Ana Output 1	Function linked to Analog Output 1 Status
10	ApOF-5	Ana Output 2	Function linked to Analog Output 2 Status
11	doUE- I	Dig Output 1	Function linked to Relay Output 1 Status
12	doUE-2	Dig Output 2	Function linked to Relay Output 2 Status
13	doUE-3	Dig Output 3	Function linked to Relay Output 3 Status (Requires Extended I/O or Cascade Option)
14	doUE-4	Dig Output 4	Function linked to Relay Output 4 Status (Requires Cascade Option)
15	doUE-5	Dig Output 5	Function linked to Relay Output 5 Status (Requires Cascade Option)
16	On	ON	Function permanently enabled
17	USEr- I	USEr 1	Function linked to User Register 1 (Function Block Program)
18	USEr-2	USEr2	Function linked to User Register 2 (Function Block Program)
19	USEr-3	USEr3	Function linked to User Register 3 (Function Block Program)
20	USEr-4	USEr4	Function linked to User Register 4 (Function Block Program)
21	USEr-5	USEr5	Function linked to User Register 5 (Function Block Program)
22	USEr-6	USEr6	Function linked to User Register 6 (Function Block Program)
23	USEr-7	USEr7	Function linked to User Register 7 (Function Block Program)
24	USEr-8	USEr8	Function linked to User Register 8 (Function Block Program)
25	USEr-9	USEr9	Function linked to User Register 9 (Function Block Program)

Parameters defined as logic sources have the following range of possible settings:-

1.4.3. Data Source Selection Parameters

Data Source selection parameters define the signal source for analog signals used within the drive, or example speed and torque setpoints. These parameters can be linked to analog values within the drive.

Parameters defined as Data Sources have the following range of possible settings:-

Progr	Programmable Logic Source Selection Options							
No.	Drive LED	Drive OLED	Setting	Reference Source				
	Display	Display						
0	R int I	Analog Input 1	Analog Input 1	Analog Input 1 Signal Level (P0-01)				
1	A in-2	Analog Input 2	Analog Input 2	Analog Input 2 Signal Level (P0-02)				
2	PrESEL	Preset Speed	Preset Speed	Selected Preset Speed				
3	d-Pot	Keypad Speed	Keypad (Motorised Pot)	Keypad Speed Reference (P0-06)				
4	Pid	PID Speed	PID Controller Output	PID Controller Output (P0-10)				
5	5Ub-dr	Master Speed	Master Speed Reference	Master Speed Reference (Master / Slave Operation)				
6	F-605	Fieldbus Speed	Fieldbus Speed Reference	Fieldbus Speed Reference PDI2				
7	USEr	User Speed Ref	User Defined Speed Reference	User Defined Speed Reference (Function Block Program)				
8	PULSE	Frequency Input	Frequency Input	Pulse Frequency Input Reference				
9	PrE- I	Preset Speed 1	Preset Speed 1	Preset Speed 1 P2-01				
10	PrE-2	Preset Speed 2	Preset Speed 2	Preset Speed 2 P2-02				
11	PrE-3	Preset Speed 3	Preset Speed 3	Preset Speed 3 P2-03

16	PrE-8	Preset Speed 8	Preset Speed 8	Preset Speed 8 P2-08				

1.4.4. Parameter Group 9 Descriptions

Par.	Name	Minimum	Maximum	Default	Units				
P9-01	Enable Input Logic Source								
	Defines the source of the Drive Enable function. This function must be provided by hardware, and is normally assigned to Digital Input								
	1, and allows a hardware enable signal to be utilised in situations where for example the Run Forward or Run Reverse commands are								
	applied from external sources, e.g. Fieldbus control signals or a Function Block Program.								
	Logic 1 : Drive operation is allowed								
P9-02	East Stop Input Logic Source	Dy P9-26 & P9-27							
1 3-02	Defines the Source of the East Stop Input. In response to a	East Stop command	the drive stops usi	ing the deceleration	time set in P2-				
	25.		,						
	Logic 1 : Drive operation is allowed								
	Logic 0 : Drive stops using the deceleration ramp time set in	n P2-25							
P9-03	Run Forward Input Logic Source								
	Defines the source of the Run Forward command.								
	Logic 1 : Drive runs the motor in the forward direction of ro	otation							
DO 04	Logic 0 : Drive stops using deceleration ramp time selected	by P9-26 & P9-27							
P9-04	Run Reverse Input Logic Source								
	Logis 1 : Drive runs the meter in the reverse direction of re-	tation							
	Logic 0 : Drive stons using deceleration ramp time selected	hy P9-26 & P9-27							
	Note								
	When both the Run Forward and Run Reverse commands a	re applied to the dr	ive simultaneously,	the drive executes	a Fast Stop.				
P9-05	Latch Function Enable Logic Source	0	1	0	-				
	0 : Disabled								
	1: Enabled. Enables the latching function of the digital input	uts.							
	The latching function allows momentary start signals to be	used to start and st	op the drive in eithe	er direction. In this o	ase, the Enable				
	Input Source (P9-01) must be linked to a normally closed / (open to stop contro	source. This contro	ol source must be Lo	2000 2000				
P9-06	Reverse Input Logic Source	y or pulse start and	stop signals as dell	neu în parameters r	·9-03 and F9-04.				
15 00	Defines the source of the Reverse command, which reverse	es the direction of m	otor rotation.						
	Note								
	The Reverse input only takes effect when the drive is opera	iting in a Forward di	rection. Therefore						
	Applying Run Forward & Reverse inputs simultan	eously = Motor Run	s Reverse						
	 Applying Run Reverse and Reverse inputs simulta 	neously = Motor Ru	ns Reverse						
P9-07	Reset Input Logic Source								
	Defines the source of the Reset command.								
	Logic 1 : Fourts are reset on a rising edge of the Reset comm	nanu.							

Par.	Name					Minimum	Maximum	Default	Units
P9-08	External 1	Frip Input	Logic Sour	ce

	23 = User Register 7, 24 = User register 8, 25 = User Registe	er 9			

1.5. Parameter Group 0 – Monitoring Parameters (Read Only)

Par	Parameter Name	Units
P0-01	Analog Input 1 Value	%
	Displays the signal level applied to analog input 1 (Terminal 6) after scaling and offsets have been applied.	
P0-02	Analog Input 2 Value	%
	Displays the signal level applied to analog input 2 (Terminal 10) after scaling and offsets have been applied.	
P0-03	Digital Input Status	Binary
	Displays the status of the drive inputs, including the extended I/O module (if fitted).	
	1 st Entry: 00000 11111. Drive digital Input status. MSB represents digital input 1 / LSB representing digital input 5	
	2 nd Entry: E 000 E 111. Drive Extended (option) Input status. MSB represents digital input 6 / LSB representing dig	sital input 8.
P0-04	Speed Controller Reference	Hz / Rpm
	Displays the set point reference input applied to the drive internal speed controller	
P0-06	Digital Speed Reference	Hz / Rpm
D0.07	Displays the value of the drive internal Motorised Pot (used for Keypad) speed reference	
P0-07	Fieldbus Speed Reference	Hz / Kpm
DU-08	Displays the set-point being received by the drive noni the currently active rieldbus interface.	%
FU-00	Displays the set-point input to the PID controller	/0
P0-09	PID Feedback	%
1005	Displays the Feedback input signal to the PID controller	70
P0-10	PID Output	%
	Displays the output level of the PID controller	,,,
P0-11	Motor Voltage	Volts
	Displays the instantaneous output voltage from the drive to the motor	
P0-12	Output Torque	%
	Displays the instantaneous output torque produced by the motor	
P0-13	Trip Log	-
	Displays the last four fault codes for the drive. Refer to section 15.1 for further information	
P0-14	Magnetising Current (Id)	А
	Displays the motor magnetising Current, providing an auto tune has been successfully completed.	
P0-15	Torque Producing Current (Iq)	A
	Displays the rotor current (torque producing current), providing an auto tune has been successfully completed.	
P0-16	DC Bus Voltage Ripple	Volts
	Displays the level of ripple present on the DC Bus Voltage. This parameter is used by the Optidrive for various interview.	nal protection
50.47	and monitoring functions.	Ohma
P0-17	Stator Resistance (KS)	Unms
DO 10	Displays the measured motor stator resistance, providing an auto tune has been successfully completed.	Hours
P0-19	Run Time values for variable sneed and DOL numps used in cascade function. 5 entry log	HOUIS
	0 = Master, 1 = D011, 2 = D012, 3 = D013, 4 = D014, Clocks can be reset through P8-20, Master Clock Reset.	
P0-20	DC Bus Voltage	Volts
	Displays the instantaneous DC Bus Voltage internally within the drive	
P0-21	Drive Temperature	°C
	Displays the Instantaneous Heatsink Temperature measured by the drive	
P0-22	Time Left to Next Service	HH:MM:SS
	Displays the current time period remaining before the next maintenance becomes due. Maintenance interval is bas	ed on the
	value entered in P6-24 (Maintenance Time Interval) and the elapsed time since the maintenance interval was enab	ed or reset.
P0-23	Time Heatsink >85° C	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with a hea	tsink
50.24	temperature in excess of 85°C. This parameter is used by the Optidrive for various internal protection and monitori	ng functions.
P0-24	Time Ambient >80 C	HH:IVIIVI:55
	Time energy usplay: First usplay shows hours, second display shows minutes and seconds. Displays the amount of time in hours and minutes that the Ontidrive has operated for during its lifetime with an an	hient
	temperature in excess of 80°C. This parameter is used by the Opticitive for various internal protection and monitori	ng functions
P0-25	Estimated Rotor Speed	Hz / Rpm
	Displays the estimated rotor speed of the motor.	
P0-26	kWh Meter	kWh
	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none resettal	ole value.
	Displays the amount of energy consumed by the drive in kWh. When the value reaches 1000, it is reset back to 0.0,	and the value
	of P0-27 (MWh meter) is increased.	
P0-27	MWh Meter	MWh
	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none resettable	ble value.
	Displays the amount of energy consumed by the drive in MWh.	

Par	Parameter Name	Units
P0-28	Software Version	-
	Displays the software version of the drive: Four entry display:	
	First display = IO Version, Second display = IO Checksum, Third display = DSP Version, Fourth display = DSP Checksu	m
P0-29	Drive Type	-
	Displays the type details of the drive: Three entry display:	
	First display = Frame size and input voltage level	
	Second display = Power rating	
	Third display = Output Phase Count	
P0-30	Serial Number	-
	Displays the unique serial number of the drive. Dual entry display:	
	First display = Serial number (MSB), Second display = Serial number (LMSB)	
P0-31	Run Time Since Date of Manufacturer	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive.	
P0-32	Run Time Since Last Trip 1	HH:MM:SS
	I wo entry display: First display shows hours. Second display shows minutes and seconds	(
	Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable	(or trip), reset
DO 22	Bun Time Since Last Trip 2	
PU-35	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable	(or trin) reset
	on next enable only if a trip occurred (under-volts not considered a trip) – not reset by nower down / nower un cyc	ling unless a
	trip occurred prior to power down.	ing uness u
P0-34	Run Time Since Last Disable	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive since the last Run command was received.	
P0-35	Fan Run Time	Hours
	Displays the total operating time of the Optidrive internal cooling fans.	
	Two entry display: First display shows user resettable time (reset with P6-22). Second display shows none resettable	e time.
	This is used for scheduled maintenance information	
P0-36	DC Bus Voltage Log (256ms)	Volts
	Diagnostic log for DC bus voltage. Values logged every 256mS with 8 samples total. Logging suspended on drive trip).
P0-37	DC Bus Voltage Ripple Log (20ms)	Volts
	Diagnostic log for DC bus voltage ripple. Values logged every 20mS with 8 samples total. Logging suspended on driv	e trip.
P0-38	Heatsink Temperature Log (30s)	°C
	Diagnostic log for heatsink temperature. Values logged every 30S with 8 samples total. Logging suspended on drive	trip.
P0-39	Drive Internal Temperature Log (30s)	°C
	Diagnostic log for drive internal temperature. Values logged every 30S with 8 samples total. Logging suspended on	drive trip.
P0-40	Motor Current Log (256ms)	A
Nete	Diagnostic log for Motor Current. Values logged every 256mS with 8 samples total. Logging suspended on drive trip	
Note	The above parameters (P0-36 to P0-40) are used to store the history of various measured levels within the drive at	various regular
DO 41	time intervals prior to a trip. The values are mozen when a fault occurs and can be used for diagnostic purposes.	
P0-41 P0-42	Over Voltage Fault Counter	-
P0-42	Under Voltage Fault Counter	-
P0-43	Heatsink Over Temperature Fault Counter	
P0-44	Brake Chonner Short Circuit Fault Counter	
P0-46	Ambient Over Temperature Fault Counter	_
Note	These parameters (P0-41 to P0-46) contain a record of how many times certain critical faults have occurred during	a drives
	operating lifetime. This provides useful diagnostic data	
P0-47	I/O comms fault counter	-
	Displays the number of communication errors detected by the I/O processor in messages received from the power	stage
	processor since the last power up	č
P0-48	DSP comms fault counter	-
	Displays the number of communication errors detected by the Power Stage processor in messages received from the	ne I/O
	processor since the last power up	
P0-49	Modbus RTU / BACnet Fault Counter	-
	This parameter is incremented every time an error occurs on the Modbus RTU communication link. This informatio	n can be used
	for diagnostic purposes.	

Par	Description	Units
P0-51	PDI Cyclic Data	-
	Displays the incoming PDI processor data when a fieldbus interface is connected and operating that supports process d	ata
	interchange, useful for fieldbus diagnostics and trouble shooting.	
P0-52	PDO Cyclic Data	-
	Displays the outgoing PDO processor data when a fieldbus interface is connected and operating that supports process	data
	interchange, useful for fieldbus diagnostics and trouble shooting.	
P0-53	Current Phase U Offset and Ref	-
	Index 1 : Reference	
	Index 2 : Sampled Value	
P0-54	Current Phase V Offset and Ref	-
	Index 1 : Reference	
	Last Fire Mode Astivation Time	Hours
PU-55	Last Fire Mode Activation Time	Hours
P0-56	Specifies the time (non-the drive metime clock) at which the Fire Mode was last activated	Minutes
F0-30	Specifies the duration of the last fire mode activation	winnutes
P0-57		_
10-57	Index 1 : Ltd	
	Index 2 : Ug	
P0-58	Load Profile Current Values	А
	This parameter has 5 indeces which hold the load profile current values following the activation of the torque monitori	ng function
	where the drive carries out a load profile autotune. See P8-06 for further information	-
P0-59	Frequency Input Reference	Hz / Rpm
	Displays the speed setpoint when a frequency input is used for the speed reference.	
P0-60	Fire Mode Total Activation Time	Minutes
	Specifies the total accumulated time that fire mode has been activated on the drive	
P0-61	Relay Control Speed Hysteresis Value	Hz / rpm
	Displays the speed hysteresis value in use for output relay settings that use hysteresis, defined by P6-04.	
P0-62	Fire Mode Total Acitvation Counter	-
	Specifies the total number of times that Fire Mode has been activated on the drive	,
P0-63	Post Ramp Speed Reference	Hz / rpm
	Displays the speed reference after all ramps and limits are applied.	
P0-64	Internal Effective Switching Frequency	-
	Shows the effective switching frequency presently active.	
P0-05	Drive Life Time	-
D0 66	Eulering Block Program ID	
F0-00	Displays the ID of any internally loaded Function Block Program	-
P0-67	Overload Integration Level	%
10-07	Displays the value of the motor thermal overload integration level in % The value in this parameter will increase if the	motor current is
	greater than the motor rated current (P1-08) or decrease if the motor current is lower than the motor rated current. V	When this value
	reaches 100% the drive will trip out on It.trP	
P0-68	User Ramp Value	S
	Displays the "User Ramp Time" value, which may be set via the internal Function Block Program.	
P0-69	I2C Error Count	-
P0-70	Option Module Type	-
	Displays the type of option module fitted in the drive option slot. The displayed values are	
	PL-EI D : Extended I/O or Cascade Module	
	PL-bU5 : Fieldbus Interface	
	PL-UnF : No Module Fitted	
	PL-UnA : Unkown or onrecognised Module	
P0-71	Fieldbus Interface Type	-
	Displays the type of option module, if fitted in the drive option slot. The displayed values are	
	n.H : No Filedbus Module	
	FFOFFO : Profibus Module Tittea	
	CENCE : DeviceNet INIOQUIE TITTEO	
	ECT : F : Ethernet IP Module fitted	
DO 73		°C
P0-72		L
P0-73	24 Hour Timer	H:MM
	Internal Value	

Par	Description	Units
P0-74	L1 – L2 Input Voltage	Volts
	Displays the supply voltage measured between L1 and L2 terminals, for indication to the user	
P0-75	L2 – L3 Input Voltage	Volts
	Displays the supply voltage measured between L2 and L3 terminals, for indication to the user	
P0-76	L3 – L1 Input Voltage	Volts
	Displays the supply voltage measured between L3 and L1 terminals, for indication to the user	
P0-77	Test Parameter 1 / 2	-
	Internal Value	
P0-78	Test Parameter 3 / 4	-
	Internal Value	
P0-79	Motor Control & DSP Version	-
	Internal Value	
P0-80	User Defined Internal Parameter	-
	Internal Value. Refer to section 1.6 for further information.	

1.6. P6-28 Value Selection

Parameter P6-28 allows the user to select an internal register which can then be displayed in parameter P0-80. To display any value from the list below, enter the corresponding index value in to P6-28. E.g. setting P6-28 = 48 reads out the 24hour timer value in P0-80

Note that any of these variables can also be read out via the plug-in Fieldbus modules by setting PDO-3 or PDO-4 to PO-80 – see section 1.3.5.

3. Immunity Tests

3.1. Electrostatic Discharge (ESD)

The Optidrive Eco product range has been designed and tested to comply with the limits defined in EN 61800-3:2004+A1-2012. The test techniques used are as defined in EN 61000-4-2:2009.

Application	Test points	Test Method	Level
	Control Torminals	Contact Discharge	±4kV
Direct	Control reminals	Air Discharge	±8kV
	Power Terminals	Air Discharge	±8kV
Indiract	Vertical coupling plane	Contact Discharge	±4kV
mairect	Horizontal coupling plane	Contact Discharge	±4kV

3.2. Electrical Fast Transient Burst (EFT/B)

The Optidrive Eco product range has been designed and tested to comply with the limits defined in EN 61800-3: 2004+A1-2012. The test techniques used are as defined in EN 61000-4-4:2004.

Test points	Test Method	Level
Control Terminals	Capacitive clamp	±1kV at 5kHz
Motor Power Terminals	Capacitive clamp	±2kV at 5kHz
1-PH Supply Power Terminals	Coupling Decoupling Network	±2kV at 5kHz
3-PH Supply Power Terminals	Capacitive clamp	±4kV at 5kHz

3.3. Surge

The Optidrive Eco product range has been designed and tested to comply with the limits defined in EN 61800-3: 2004+A1-2012. The test techniques used are as defined in EN 61000-4-5:2006.

Drive Type	Test Method	Level
200 2401/	Line to Line/Neutral	±1kV
200-2407	Line/Neutral to Earth	±2kV
200 4001	Line to Line	±2kV
360-480V	Line to Earth	±4kV

3.4. Dielectric strength (Flash)

The Optidrive Eco product range has been designed and tested to comply with the limits defined in EN 61800-5-1: 2007. The test techniques used are as defined in EN 61800-5-1: 2007.

Drive Type	Level
200-240V	1.5kV
380-480V	2.5kV

4. General Technical and Performance Data

4.1. Electrical Data

4.1.1. Mains Supply Details	
Supply Voltage Range	230 Volt Units – 200 – 240 Volt +10% / -10%
	400 Volt Units – 380 – 480 Volt +10% / -10%
	600 Volt Units – 500 – 600 Volt +10% / -10%
Supply Frequency	48 – 62Hz
Inrush Current	< rated input current
Power Up Cycles	>120 x / hr, evenly spaced
Single Phase Operation	This is only possible with the dedicated single phase input drives – supplying a three phase drive with
	single phase is not possible in this product range
4.1.2. Motor Control	
Output Frequency Range	0 to 500Hz in 0.1 Hz steps
	Max Output Frequency = Max Switching Frequency / 16.
Output Voltage Range	0 to Supply Voltage
Speed Regulation	Open Loop < 1% motor rated speed
Effective Switching Frequency	4 – 32kHz – Drive size dependant
Acceleration Time	Four independent acceleration ramps
	0 – 600 seconds, 0.01s resolution (Frame 2 & 3)
	0 – 6000 seconds, 0.1s resolution (Frame 4 & above)
Deceleration Time	Four individual deceleration ramps
	0 – 600 seconds, 0.01s resolution (Frame 2 & 3)
	0 – 6000 seconds, 0.1s resolution (Frame 4 & above)
4.1.3. Overload Capacity	
Overload Capacity	110% of rated current for 60 seconds, repeat cycle every 10 minutes.
	150% of rated current for 1 second, repeat cycle every 10 minutes

4.2. Digital & Analog I/O

•						
4.2.1. Digital Inputs Specification	. Digital Inputs Specification					
Voltage Range	8 – 30 V dc, Internal or External supply, NPN (positive logic)					
Response Time	< 8ms					
4.2.2. Inhibit (Safe) Input						
Voltage Range	Inhibit input 18 – 30V dc					
Response Time	Inhibit input < 100us for shutdown					
2.3. Analog Inputs Specification						
Range	Current : 0-20mA, 4-20mA. 20mA max input current Voltage: -10-10V (Analog Input 1 Only), 0-10V, 0-5V, 0/24V, 30V max input					
Resolution	Analog Input 1: 12-bit + sign, <16ms response time (bipolar) Analog Input 2: 12-bit, <16ms response time (Uni-Polar)					
Accuracy	better than 1% of full scale					
Scaling & Offset	Parameter adjustable					
4.2.4. Analog Outputs Specifica	Analog Outputs Specification					
Range	Current : 020mA, 420mA, 20mA max Analog : 010V, 0 / 24V (digital), 20mA max					
Resolution	10-bit					
Accuracy	better than 1% of full scale					
4.2.5. Relay Outputs (1x N.O, 1 Maximum Switching Voltage : Maximum Switching Current :	x C.O) 250VAC, 30 VDC 5A at 30 Volt DC, 6A at 250 Volt AC					

4.3. Environmental Data

4.3.1. Temperature Range					
Ambient Temperature Range : Operation	IP20 Drives : -10 - +50°C (14 - 122°F) without derating				
	IP55 & IP66 Drives : -10 - + 40°C (14 - 104°F) without derating				
Note : No frost or condensation permissible					
Ambient Temperature Range : Storage	-40 60 °C. No Frost or Condensation				
4.3.2. Altitude					
Maximum Altitude (No derating)	1000m Derate above 1000m by 1% per 100m				
Maximum Altitude (UL Approved)	2000m				
Maximum Altitude	4000m				
4.3.3. Relative Humidity					
Relative Humidity Limit	95% Maximum, non-condensing				
4.3.4. Vibration Levels					
Bump Test	Testing in each of three mutually perpendicular axes in turn.				
	Reference standard: IEC 60068-2-29				
	Severity: 18g, 6ms, half sine				
	No of bumps: 600 (100 per axis)				
Random Vibration Test	BS EN61800-5-1				
Sinusoidal vibration test	BS EN61800-5-1				

4.4. Response Times

Command Source	Response Time
STO Input	<25ms
Digital Input	<8ms
Analog Input	<16ms
Modbus RTU Interface	<8ms From receipt of valid command
BACnet MSTP Interface	<8ms From receipt of valid command
Extended I/O Option	<8ms
Plug In Fieldbus Option	<20ms + Fieldbus Cycle Time From receipt of valid command
Master / Slave Function	<8ms, response, 60ms cycle
Power Stage	<10ms to enable output

4.5. Output Current Limit

4.5.1. Overload Operation

Optidrive Eco provides the following

- 110% Output current / 60 Seconds Maximum
- 150% Output current / 0.98 Seconds Maximum

At low output frequency levels, overload accumulation is faster, to account for the reduced motor cooling effect of the fan.

4.5.2. Overview

Optidrive Eco features both hardware and software protection of the output stage to prevent damage. In addition, an Ixt system is used to monitor motor overload condition and prevent damage to the motor due to operation for prolonged periods at high load.

Ix t protection is software based, using the value for motor rated current programmed in P1-08. An internal accumulator register is used to estimate the point at which damage may occur to the motor, and operates as follows

Motor Current < P1-08

The accumulator value reduces towards zero. The time required depends on the actual load current as explained further below.

Motor Current = 100% P1-08

The accumulator value remains static.

Motor Current > 100% P1-08 < 110% P1-08

The accumulator value increases at a rate proportional to the overload level, e.g. (Motor Current / Rated current) – 100%. If the overload limit is reached, the drive will trip, displaying it.trp. to protect the motor.

Motor Current > 110% P1-08

For high current levels, the accumulator operates 16 times faster than for current levels below 110% of P1-08.

160% 150% 140% 130% 120% 10% 0.10 1.00 1

4.5.3. Overload Curve

4.6. Under / Over Voltage Trip Levels

The following levels are not user adjustable, and define the operating voltage levels of the drive and brake chopper circuit.

Drive Rated Supply	DC Bus Voltage Level (Volts DC)			
Voltage	Under Voltage Trip	Minimum Operating	Over Voltage Trip	
200 – 240 Volts AC	160	239	418	
380 – 480 Volts AC	320	474	835	
480 – 525 Volts AC	360	540	930	
500 – 600 Volts AC	400	598	1020
