Declaration of Conformity

Invertek Drives Ltd hereby states that the Optidrive ODE-3 product range conforms to the relevant safety provisions of the following council directives:

2014/30/EU (EMC) and 2014/35/EU (LVD)

Designed and manufacture is in accordance with the following harmonised European standards:

| EN 61800-5-1: 2007 | Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy. |
|---------------------------|---|
| EN 61800-3: 2004 /A1 2012 | Adjustable speed electrical power drive systems. EMC requirements and specific test methods |
| EN 55011: 2007 | Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and medical (ISM) radio- frequency equipment (EMC) |
| EN60529: 1992 | Specifications for degrees of protection provided by enclosures |

Electromagnetic Compatibility

All Optidrives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the mains supply via the power cables for compliance with the above harmonised European standards.

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use, and the relevant category. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. This User Guide provides guidance to ensure that the applicable standards may be achieved.

2 Year Warranty

All Invertek Optidrive units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification. The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

This user guide is the "original instructions" document. All non-English versions are translations of the "original instructions".

The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

This User Guide is for use with version 3.08 Firmware

User Guide Revision 1.00

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

When installing the drive on any power supply where the phase-ground voltage may exceed the phase-phase voltage (typically IT supply networks or Marine vessels) it is essential that the internal EMC filter ground and surge protection varistor ground (where fitted) are disconnected. If in doubt, refer to your Sales Partner for further information.

This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

1.1. Important Safety Information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

This variable speed drive product (Optidrive) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The Optidrive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be carried out with the Optidrive disconnected.

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

Danger: Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

Within the European Union, all machinery in which this product is used must comply with Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.

IP20 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54 or better.

Optidrives are intended for indoor use only.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered.

Never connect the mains power supply to the Output terminals U, V, W.

Do not install any type of automatic switchgear between the drive and the motor.

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees. Ensure that all terminals are tightened to the appropriate torque setting.

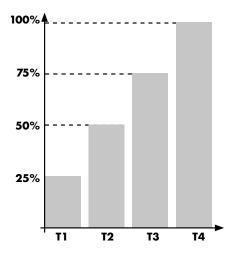

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

1.2. Quick Start Process

| Step | Action | See section | Page |
|------|--|--|----------------------|
| 1 | Identify the Enclosure Type, Model Type and ratings of your drive from the model code on the label. In particular - Check the voltage rating suits the incoming supply - Check the output current capacity meets or exceeds the full load current for the intended motor | 2.1. Identifying the Drive by Model Number | 7 |
| 2 | Unpack and check the drive. Notify the supplier and shipper immediately of any damage. | | |
| 3 | Ensure correct ambient and environmental conditions for the drive are met by the proposed mounting location. | 9.1. Environmental | 34 |
| 4 | Install the drive in a suitable cabinet (IP20 Units) ensuring suitable cooling air is available. | 3.1. General3.3. Mechanical Dimensions and Mounting – IP20Open Units3.4. Guidelines for Enclosure Mounting | 9 9 10 |
| 5 | Select the correct power and motor cables according to local wiring regulations or code, noting the maximum permissible sizes | 9.2. Rating Tables | 34 |
| 6 | If the supply type is IT or corner grounded, disconnect the EMC filter before connecting the supply. | 9.5. EMC Filter Disconnect | 36 |
| 7 | Check the supply cable and motor cable for faults or short circuits. | | |
| 8 | Route the cables. | | |
| 9 | Check that the intended motor is suitable for use, noting any precautions recommended by the supplier or manufacturer. | 4.9. EMC Compliant Installation | 15 |
| 10 | Check the motor terminal box for correct Star or Delta configuration where applicable. | 4.5. Motor Terminal Box Connections | 13 |
| 11 | Ensure wiring protection is providing, by installing a suitable circuit breaker or fuses in the incoming supply line. | 4.3.2. Fuse / Circuit Breaker Selection 9.2. Rating Tables | 12 34 |
| 12 | Connect the power cables, especially ensuring the protective earth connection is made. | 4.1. Connection Diagram4.2. Protective Earth (PE) Connection4.3. Incoming Power Connection4.4. Motor Connection | 11 11 12 12 |
| 13 | Connect the control cables as required for the application. | 4.6. Control Terminal Wiring4.9. EMC Compliant Installation7. Analog and Digital Input Macro Configurations7.2. Example Connection Diagrams | 13 15 27 27 |
| 14 | Thoroughly check the installation and wiring. | | |
| 15 | Commission the drive parameters. | 5.1. Managing the Keypad 6. Parameters | 16 18 |

1.3. Installation Following a Period of Storage

Where the drive has been stored for some time prior to installation, or has remained without the main power supply present for an extended period of time, it is necessary to reform the DC capacitors within the drive according to the following table before operation. For drives which have not been connected to the main power supply for a period of more than 2 years, this requires a reduced mains voltage mains voltage to be applied for a time period, and gradually increased prior to operating the drive. The voltage levels relative to the drive rated voltage, and the time periods for which they must be applied are shown in the following table. Following completion of the procedure, the drive may be operated as normal.

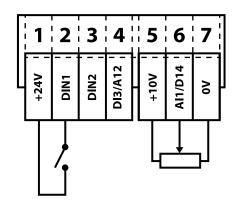

| Storage Period /Power-OFF Period | Initial Input Voltage Level | Time Period T1 | Secondary Input Voltage Level | Time Period T2 | Third Input Voltage Level | Time Period T3 | Final Input Voltage Level | Time Period T4 |
|--|--------------------------------------|-------------------|--|-------------------|------------------------------------|-------------------|------------------------------------|-------------------|
| Up to 1 Year | 100% | | | | N/A | | | |
| 1 – 2 Years | 100% | 1 Hour | 1 Hour N/A | | | | | |
| 2 – 3 Years | 25% | 30 Minutes | 50% | 30 Minutes | 75% | 30 Minutes | 100% | 30 Minutes |
| More than 3 Years | 25% | 2 Hours | 50% | 2 Hours | 75% | 2 Hours | 100% | 2 Hours |

1.4. Quick Start Overview

Quick Start – IP20

- Connect a Start / Stop switch between control terminals 1 & 2
 - o Close the Switch to Start
 - o Open to Stop
- Connect a potentiometer (5k 10kΩ) between terminals 5, 6 and 7 as shown
 - o Adjust the potentiometer to vary the speed from P-O2 (OHz default) to P-O1 (50 / 60 Hz default)

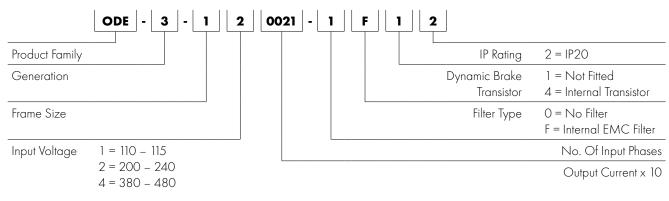

2. General Information and Ratings

This chapter contains information about the Optidrive E3 including how to identify the drive.

2.1. Identifying the Drive by Model Number

Each drive can be identified by its model number, as shown in the table below. The model number is on the shipping label and the drive nameplate. The model number includes the drive and any options.

2.2. Drive Model Numbers

| 110 |) – 115V ± 10% - 1 Phase In | put – 3 Phase 23 | 30V Output (Vo | ltage Doubler) | |

3. Mechanical Installation

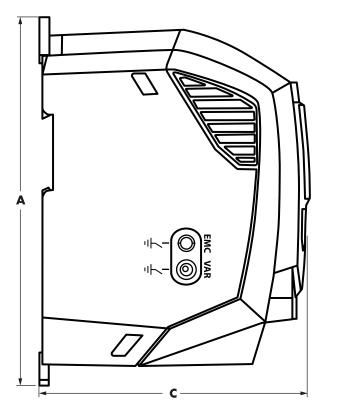

3.1. General

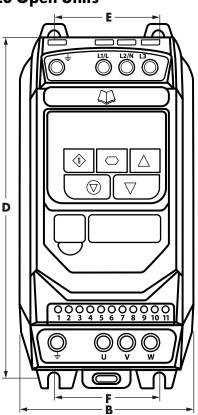

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes or DIN Rail clip (Frame Sizes 1 and 2 only).
- IP20 Optidrives must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the Optidrive.
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 9.1. Environmental.
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive.

3.2. UL Compliant Installation

Refer to section 9.4. Additional Information for UL Compliance on page 35 for Additional Information for UL Compliance.

3.3. Mechanical Dimensions and Mounting – IP20 Open Units

| 4 | 4 × M8 | 4 | 0.5 Nm (4.5 lb-in) | 2 Nm (18 lb-in) | | | |
| 5 | 4 × M8 | 5 | 0.5 Nm (4.5 lb-in) | 4 Nm (35.5 lb-in) | | | |

3.4. Guidelines for Enclosure Mounting

- IP20 drives are suitable for use in pollution degree 1 environments, according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.
- The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:

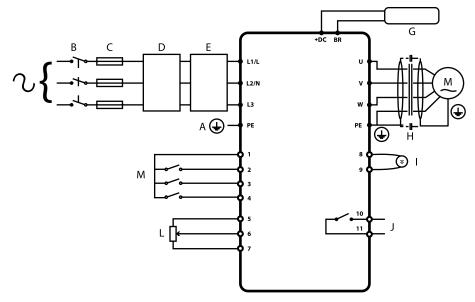

| Drive Size | X Drive Size Above & Below | | Y Either Side | | Bet | Z ween | Recommended airflow |
|---|-------------------------------|------|------------------|------|-----|-----------|------------------------|
| | mm | in | mm | in | mm | in | CFM (ft3/min) |
|] | 50 | 1.97 | 50 | 1.97 | 33 | 1.30 | 11 |
| 2 | 75 | 2.95 | 50 | 1.97 | 46 | 1.81 | 22 |
| 3 | 100 | 3.94 | 50 | 1.97 | 52 | 2.05 | 60 |
| 4 | 100 | 3.94 | 50 | 1.97 | 52 | 2.05 | 120 |
| 5 | 200 | 7.87 | 25 | 0.98 | 70 | 2.76 | 104 |
| Dimension Z assumes that the drives are mounted side-by-side with no clearance. | | | | | | | |

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

4.2. Protective Earth (PE) Connection

Grounding Guidelines

The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically.

Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

Safety Ground

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply:

- A Type B Device must be used.
- The device must be suitable for protecting equipment with a DC component in the leakage current.
- Individual ELCBs should be used for each Optidrive.

www.invertekdrives.com

Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

4.3. Incoming Power Connection

4.3.1. Cable Selection

- For 1 phase supply, the mains power cables should be connected to L1/L, L2/N.
- For 3 phase supplies, the mains power cables should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, refer to section 4.9. EMC Compliant Installation on page 15.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Maximum dimensions are given in section 9.2. Rating Tables.

4.3.2. Fuse / Circuit Breaker Selection

- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 9.2. Rating Tables. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type J fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is 100kA.

4.3.3. Optional Input Choke

- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:
 - o The incoming supply impedance is low or the fault level / short circuit current is high.
 - o The supply is prone to dips or brown outs.
 - o An imbalance exists on the supply (3 phase drives).
 - o The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

| Supply | Frame Size | AC Input Inductor |
|---------------------|------------|-------------------|
| | 1 | OPT-2-L1016-20 |
| 230 Volt 1 Phase | 2 | OPT-2-L1025-20 |
| T THUSE | 3 | N/A |
| | 1 | OPT-2-L3006-20 |
| 400 Volt | 2 | OPT-2-L3010-20 |
| 3 Phase | 3 | OPT-2-L3036-20 |
| | 4 | OPT-2-L3050-20 |
| | 5 | OPT-2-L3090-20 |

4.4. Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the Optidrive earth terminals.
- Maximum permitted motor cable length for all models: 100 metres shielded, 150 metres unshielded.
- Where multiple motors are connected to a single drive using parallel cables, an output choke **must** be installed.

4

4

4.5. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor. This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

| Incoming Supply Voltage | Motor Nameplate Voltages | | Connection |
|-------------------------|--------------------------|-----------|------------|
| 230 | 230 / 400 | Delta | |
| 400 | 400 / 690 | Δ | |
| 400 | 230 / 400 | Star A | |

4.6. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm.
- Control Cable entry conductor size: 0.05 2.5mm2 / 30 12 AWG.

4.7. Control Terminal Connections

| Default Connections | Control Terminal | Signal | Description |
|----------------------------|-------------------------|-------------------------------------|---|
| | | | +24Vdc user output, 100mA. |
| | 1 | +24Vdc User Output | Do not connect an external voltage source to this terminal. |
| | 2 | Digital Input 1 | Positive logic |
| | 3 | Digital Input 2 | "Logic 1" input voltage range: 8V 30V DC "Logic 0" input voltage range: 0V 4V DC |
| | 4 | Digital Input 3 /Analog Input 2 | Digital: 8 to 30V Analog: 0 to 10V, 0 to 20mA or 4 to 20mA |
| | 5 | +10V User Output | +10V, 10mA, 1kΩ minimum |
| | 6 | Analog Input 1 / Digital Input 4 | Analog: 0 to 10V, 0 to 20mA or 4 to 20mA Digital: 8 to 30V |
| | 7 | OV | 0 Volt Common, internally connected to terminal 9 |
| V V | 8 | Analog Output / Digital Output | Analog: 0 to 10V, Digital: 0 to 24V 20mA maximum |
| | 9 | OV | 0 Volt Common, internally connected to terminal 7 |
| | 10 | Auxiliary Relay Common | |
| | 11 | Auxiliary Relay NO Contact | Contact 250Vac, 6A / 30Vdc, 5A Intended to drive resistive load. |

4.7.1. Analog Output

The analog output function may be configured using parameter P-25, which is described in section 6.2. Extended Parameters on page 20.

The output has two operating modes, dependent on the parameter selection:

- Analog Mode
 - o The output is a 0 10 volt DC signal, 20mA max load current.
- Digital Mode

o The output is 24 volt DC, 20mA max load current.

4.7.2. Relay Output

The relay output function may be configured using parameter P-18, which is described in section 6.2. Extended Parameters on page 20.

4.7.3. Analog Inputs

Two analog inputs are available, which may also be used as Digital Inputs if required. The signal formats are selected by parameters as follows:

- Analog Input 1 Format Selection Parameter P-16.
- Analog Input 2 Format Selection Parameter P-47.

These parameters are described more fully in section 6.2. Extended Parameters on page 20.

The function of the analog input, e.g. for speed reference or PID feedback for example is defined by parameters P-15. The function of these parameters and available options is described in section 7. Analog and Digital Input Macro Configurations on page 27.

4.7.4. Digital Inputs

Up to four digital inputs are available. The function of the inputs is defined by parameters P-12 and P-15, which are explained in section 7. Analog and Digital Input Macro Configurations on page 27.

4.8. Motor Thermal Overload Protection

4.8.1. Internal Thermal Overload Protection

Optidrive E3 has internal motor overload protection / current limit set at 150% of FLA. This may be adjusted in parameter P-54. The drive has an in-built motor thermal overload function; this is in the form of an "I.t-trP" trip after delivering >100% of the value set in P-08 for a sustained period of time (e.g. 150% for 60 seconds).

4.8.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:

| Control Terminal Strip | Additional Information |
|------------------------|---|
| | Compatible Thermistor: PTC Type, 2.5kΩ trip level. Use a setting of P-15 that has Input 3 function as External Trip, e.g. P-15 = 3. Refer to section 7. Analog and Digital Input Macro Configurations on page 27 for further details. Set P-47 = "Ptc-th" |

4.9. EMC Compliant Installation

| Category | Supply Cable Type | Motor Cable Type | Control Cables | Maximum Permissible Motor Cable Length |
|----------|-------------------------|--------------------------|-----------------------|---|
| C 16 | Shielded ¹ | Shielded ^{1,5} | | 1M / 5M ⁷ |
| C2 | Shielded ² | Shielded ^{1, 5} | Shielded ⁴ | 5M / 25M ⁷ |
| C3 | Unshielded ³ | Shielded ² | | 25M / 100M ⁷ |

¹ A screened (shielded) cable suitable for fixed installation with the relevant mains voltage in use. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals. Installation of a standard cable within a suitable steel or copper tube is also acceptable.

- ² A cable suitable for fixed installation with relevant mains voltage with a concentric protection wire. Installation of a standard cable within a suitable steel or copper tube is also acceptable.
- ³ A cable suitable for fixed installation with relevant mains voltage. A shielded type cable is not necessary.
- ⁴ A shielded cable with low impedance shield. Twisted pair cable is recommended for analog signals.
- ⁵ The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area. Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- ⁶ Compliance with category C1 conducted emissions only is achieved. For compliance with category C1 radiated emissions, additional measures may be required, contact your Sales Partner for further assistance.
- ⁷ Permissible cable length with additional external EMC filter.

4.10. Optional Brake Resistor

Optidrive E3 Frame Size 2 and above units have a built in Brake Transistor. This allows an external resistor to be connected to the drive to provide improved braking torque in applications that require this.

The brake resistor should be connected to the "+" and "BR" terminals as shown.

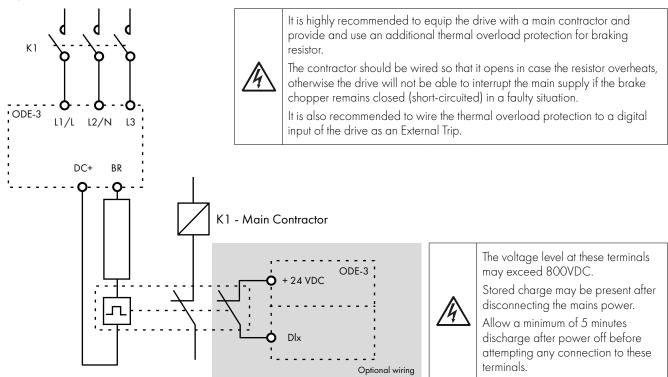

The voltage level at these terminals may exceed 800VDC.

Stored charge may be present after disconnecting the mains power.

Allow a minimum of 10 minutes discharge after power off before attempting any connection to these terminals.

Suitable resistors and guidance on selection can be obtained from your Invertek Sales Partner.

5. Operation

5.1. Managing the Keypad

The drive is configured and its operation monitored via the keypad and display.

| | NAVIGATE | Used to display real-time information, to access and exit parameter edit mode and to store parameter changes. | |
|------------|-----------------|--|--|
| | UP | Used to increase speed in real-time mode or to increase parameter values in parameter edit mode. | |
| \square | DOWN | Used to decrease speed in real-time mode or to decrease parameter values in parameter edit mode. | |
| \bigcirc | reset / stop | Used to reset a tripped drive. When in Keypad mode is used to Stop a running drive. | |
| | START | When in keypad mode, used to Start a stopped drive or to reverse the direction of rotation if bi-directional keypad mode is enabled. | |

5.2. Operating Displays

6.2. Extended Parameters

| Par. | Description | Minimum | Maximum | Default | Units | | | | |
|------|---|---|--|---|-------------|--|--|--|--|
| P-15 | Digital Input Function Select | 0 | 18 | 0 | - | | | | |
| | Defines the function of the digital inputs depending on the control mod Macro Configurations for more information. | e setting in P-12. | See section 7. A | nalog and Di | gital Input | | | | |
| P-16 | Analog Input 1 Signal Format | See E | Below | U0-10 | - | | | | |
| | U D- ID = Uni-polar 0 to 10 Volt Signal. The drive will remain at minim offset are applied is =<0.0%. 100% signal means the output frequency | | | | scaling and | | | | |
| | b 0-10 = Uni-polar 0 to 10 Volt Signal, bi-directional operation. The direction of rotation if the analog reference after scaling and offset are volt signal, set P-35 = 200.0%, P-39 = 50.0%. R 0-20 = 0 to 20mA Signal. E 4-20 = 4 to 20mA Signal, the Optidrive will trip and show the faul r 4-20 = 4 to 20mA Signal, the Optidrive will run at Preset Speed 1 E 20-4 = 20 to 4mA Signal, the Optidrive will trip and show the fault | e applied is <0.0 t code 4-2DF if (P-20 if the signc | %. E.g. for bidired the signal level fo I level falls belov | ctional contro Ills below 3m v 3mA. | A. | | | | |
| | | | - | | | | | | |
| | U ID-D = 10 to 0 Volt Signal (Uni-polar). The drive will operate at Ma | • | | | | | | | |
| | reference after scaling and offset are applied is =<0.0%. | | | | | | | | |
| P-17 | Maximum Effective Switching Frequency | 4 | 32 | 8 | kHz | | | | |
| | | Sets maximum effective switching frequency of the drive. If "rEd" is displayed when the parameter is viewed, the switching frequency has been reduced to the level in POO-32 due to excessive drive heatsink temperature. | | | | | | | |
| P-18 | Output Relay Function Select | 0 | 9 | 1 | - | | | | |
| | 0: Drive Enabled (Running). Logic 1 when the motor is enabled. 1: Drive Healthy. Logic 1 when power is applied to the drive and 2: At Target Frequency (Speed). Logic 1 when the output frequence 3: Drive Tripped. Logic 1 when the drive is in a fault condition. 4: Output Frequency >= Limit. Logic 1 when the output frequence 5: Output Current >= Limit. Logic 1 when the motor current exceed 6: Output Frequency < Limit. Logic 1 when the output frequency 7: Output Current < Limit. Logic 1 when the motor current is below 8: Analog Input 2 > Limit. Logic 1 when the signal applied to analog 9: Drive Ready to Run. Logic 1 when the drive is ready to run, not | no fault exists. ency matches the cy exceeds the ad- eds the adjustabl v is below the adj w the adjustable og input 2 exceed trip present. | djustable limit set e limit set in P- 19. ustable limit set ir limit set in P- 19. ds the adjustable l | in P-19. n P-19. imit set in P-19 | | | | | |
| P-19 | Relay Threshold Level | 0.0 | 200.0 | 100.0 | % | | | | |
| | Adjustable threshold level used in conjunction with settings 4 to 8 of P- | 18. | | | | | | | |
| P-20 | Preset Frequency / Speed 1 | -P-01 | P-01 | 5.0 | Hz / RPN | | | | |
| P-21 | Preset Frequency / Speed 2 | -P-01 | P-01 | 25.0 | Hz / RPN | | | | |
| P-22 | Preset Frequency / Speed 3 | -P-01 | P-01 | 40.0 | Hz / RPN | | | | |
| P-23 | Preset Frequency / Speed 4 | -P-01 | P-01 | P-09 | Hz / RPN | | | | |
| | Preset Speeds / Frequencies selected by digital inputs depending on the setting of P-15. If P-10 = 0, the values are entered as Hz. If P-10 > 0, the values are entered as RPM. NOTE Changing the value of P-09 will reset all values to factory default settings. | | | | | | | | |
| | | 0.00 | 600.0 | 0.00 | | | | | |
| P-24 | 2nd Ramp Time (Fast Stop) | | | | S | | | | |

| Par. | Description | Minimum | Maximum | Default | Units | | | | | |
|------|--|---|---|-----------------------------|----------|--|--|--|--|--|
| P-25 | Analog Output Function Select | 0 | 11 | 8 | - | | | | | |
| | Digital Output Mode. Logic 1 = +24V DC | | | | | | | | | |
| | 0: Drive Enabled (Running). Logic 1 when the Optidrive is end | abled (Runnina). | | | | | | | | |
| | 1: Drive Healthy. Logic 1 When no Fault condition exists on the | • | | | | | | | | |
| | 2: At Target Frequency (Speed). Logic 1 when the output free | | e setpoint freque | ency. | | | | | | |
| | 3: Drive Tripped. Logic 1 when the drive is in a fault condition. | , | | / | | | | | | |
| | 4: Output Frequency >= Limit. Logic 1 when the output frequency exceeds the adjustable limit set in P-19. | | | | | | | | | |
| | 5: Output Current >= Limit. Logic 1 when the motor current exc | ceeds the adjustab | ole limit set in P-19 | 7. | | | | | | |
| | 6: Output Frequency < Limit. Logic 1 when the output frequen | cy is below the ac | ljustable limit set | in P-19. | | | | | | |
| | 7: Output Current < Limit. Logic 1 when the motor current is be | low the adjustable | e limit set in P-19. | | | | | | | |
| | Analog Output Mode | | | | | | | | | |
| | 8: Output Frequency (Motor Speed). O to P-01, resolution O | .1 Hz. | | | | | | | | |
| | 9: Output (Motor) Current. 0 to 200% of P-08, resolution 0.1/ | ۹. | | | | | | | | |
| | 10: Output Power. 0 – 200% of drive rated power. | | | | | | | | | |
| | 11: Load Current. 0 – 200% of P-08, resolution 0.1 A. | | | | | | | | | |
| P-26 | Skip Frequency Hysteresis Band | 0.0 | P-01 | 0.0 | Hz / RPM | | | | | |
| P-27 | Skip Frequency Centre Point | 0.0 | P-01 | 0.0 | Hz / RPM | | | | | |
| P-28 | and is used in conjunction with P-26. The Optidrive output frequency P-04 respectively, and will not hold any output frequency within the within the band, the Optidrive output frequency will remain at the up | defined band. If th | e frequency refe | | | | | | | |
| | V/F Characteristic Adjustment Voltage | | - | - | - | | | | | |
| P-29 | V/F Characteristic Adjustment Voltage | 0.0 | P-09 | 0.0 | Hz | | | | | |
| | This parameter in conjunction with P-28 sets a frequency point at which the voltage set in P-29 is applied to the motor. Care must be taken to avoid overheating and damaging the motor when using this feature. | | | | | | | | | |
| P-30 | Start Mode, Automatic Restart, Fire Mode Operation | | | | | | | | | |
| | Index 1: Start Mode & Automatic Restart | N/A | N/A | Edge-r | - | | | | | |
| | Selects whether the drive should start automatically if the enable input is present and latched during power on. Also configures the | | | | | | | | | |
| | Automatic Restart function. Edge-r: Following Power on or reset, the drive will not start if Digital Input 1 remains closed. The Input must be closed after a | | | | | | | | | |
| | power on or reset to start the drive. | | | | | | | | | |
| | RULo-D: Following a Power On or Reset, the drive will automatically start if Digital Input 1 is closed. | | | | | | | | | |
| | AULD- I TO AULD- 5: Following a trip, the drive will make up to 5 attempts to restart at 20 second intervals. The | | | | | | | | | |
| | numbers of restart attempts are counted, and if the drive fails to start on the final attempt, the drive will trip with a fault, and will require the user to manually reset the fault. The drive must be powered down to reset the counter. | | | | | | | | | |
| | | ed down to reser it | ne counter. | 1 | | | | | | |
| | | _ | _ | - | | | | | | |
| | Index 2: Fire Mode Input Logic | 0 | 1 | 0 | - | | | | | |

| P-52 | Motor Parameter Autotune | 0 | 1 | 0 | - | | | | | |
| | 0: Disabled | • | • | • | | | | | | |
| | 1: Enabled. When enabled, the drive immediately measures require related parameters are correctly set first before enabling this parameter. This parameter can be used to optimise the performance when P-51 = Autotune is not required if P-51 = 1. For settings 2 – 5 of P-51, autotune MUST be carried out AFTER all of | er. O. | | | sure all motor | | | | | |
| P-53 | Vector Mode Gain | 0.0 | 200.0 | 50.0 | % | | | | | |
| | Single Parameter for Vector speed loop tuning. Affects P & I terms simultaneously. Not active when P-51 = 1. | | | | | | | | | |
| P-54 | Maximum Current Limit | 0.0 | 175.0 | 150.0 | % | | | | | |
| | Defines the max current limit in vector control modes | | | | | | | | | |
| P-55 | Motor Stator Resistance | 0.00 | 655.35 | - | Ω | | | | | |
| | Motor stator resistance in Ohms. Determined by Autotune, adjustment | is not normally re | equired. | | | | | | | |
| P-56 | Motor Stator d-axis Inductance (Lsd) | 0.00 | 655.35 | - | mH | | | | | |
| | Determined by Autotune, adjustment is not normally required. | | | | | | | | | |
| P-57 | Motor Stator q-axis Inductance (Lsq) | 0.00 | 655.35 | - | mH | | | | | |
| | Determined by Autotune, adjustment is not normally required. | | | | | | | | | |
| P-58 | DC Injection Speed | 0.0 | P-01 | 0.0 | Hz / RPA | | | | | |
| | Sets the speed at which DC injection current is applied during braking zero speed if desired. | to Stop, allowin | g DC to be injec | ted before the | drive reache | | | | | |
| P-59 | DC Injection Current | 0.0 | 100.0 | 20.0 | % | | | | | |
| | Sets the level of DC injection braking current applied according to the | conditions set in | P-32 and P-58. | | | | | | | |
| P-60 | Motor Overload Management | - | - | - | - | | | | | |
| | Index 1: Thermal Overload Retention | 0 | 1 | 1 | 1 | | | | | |
| | O: Disabled 1: Enabled. When enabled, the drive calculated motor overload protection information is retained after the mains power is removed from the drive. | | | | | | | | | |
| | Index 2: Thermal Overload Limit Reaction | 0 | 1 | 1 | 1 | | | | | |
| | O: It.trp. When the overload accumulator reaches the limit, the drive 1: Current Limit Reduction. When the overload accumulator reaction 100% of P-08 in order to avoid an It.trp. The current limit will return to the | ches 90% of, the | output current lim | nit is internally r | | | | | | |

| 6.4. P | -00 Read | Only Status | Parameters |
|--------|----------|--------------------|-------------------|
|--------|----------|--------------------|-------------------|

| Par. | Description | Explanation |
|--------|---|---|
| P00-01 | 1 st Analog input value (%) | 100% = max input voltage |
| P00-02 | 2nd Analog input value (%) | 100% = max input voltage |
| P00-03 | Speed reference input (Hz / RPM) | Displayed in Hz if P-10 = 0, otherwise RPM |
| P00-04 | Digital input status | Drive digital input status |
| P00-05 | User Pl output (%) | Displays value of the User PI output |
| P00-06 | DC bus ripple (V) | Measured DC bus ripple |
| P00-07 | Applied motor voltage (V) | Value of RMS voltage applied to motor |
| P00-08 | DC bus voltage (V) | Internal DC bus voltage |
| P00-09 | Heatsink temperature (°C) | Temperature of heatsink in °C |
| P00-10 | Run time since date of manuf. (Hours) | Not affected by resetting factory default parameters |
| P00-11 | Run time since last trip (1) (Hours) | Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred. Reset also on next enable after a drive power down |
| P00-12 | Run time since last trip (2) (Hours) | Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred (under-volts not considered a trip) – not reset by power down / power up cycling unless a trip occurred prior to power down |
| P00-13 | Trip Log | Displays most recent 4 trips with time stamp |
| P00-14 | Run time since last enable, HH:MM:SS | Run-time clock stopped on drive disable, value reset on next enable |
| P00-15 | DC bus voltage log (V) | 8 most recent values prior to trip, 256ms sample time |
| P00-16 | Heatsink temperature log (°C) | 8 most recent values prior to trip, 30s sample time |
| P00-17 | Motor current log (A) | 8 most recent values prior to trip, 256ms sample time |
| P00-18 | DC bus ripple log (V) | 8 most recent values prior to trip, 22ms sample time |
| P00-19 | Internal drive temperature log (°C) | 8 most recent values prior to trip, 30 s sample time |
| P00-20 | Internal drive temperature (°C) | Actual internal ambient temperature in °C |
| P00-21 | CAN process data input | Incoming process data (RX PDO1) for CAN: PI1, PI2, PI3, PI4 |
| P00-22 | CAN process data output | Outgoing process data (TX PDO1) for CAN: PO1, PO2, PO3, PO4 |
| P00-23 | Accumulated time with heatsink > 85°C (Hours) | Total accumulated hours and minutes of operation above heatsink temp of 85°C |
| P00-24 | Accumulated time with drive internal temp > 80°C (Hours) | Total accumulated hours and minutes of operation with drive internal ambient above 80°C |
| P00-25 | Estimated rotor speed (Hz) | In vector control modes, estimated rotor speed in Hz |
| P00-26 | kWh meter / MWh meter | Total number of kWh / MWh consumed by the drive |
| P00-27 | Total run time of drive fans (Hours) | Time displayed in hh:mm:ss. First value displays time in hrs, press up to display mm:ss |
| P00-28 | Software version and checksum | Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates power stage |
| P00-29 | Drive type identifier | Drive rating, drive type and software version codes |
| P00-30 | Drive serial number | Unique drive serial number |
| P00-31 | Motor current Id / Iq | Displays the magnetising current (Id) and torque current (Iq). Press UP to show Iq |
| P00-32 | Actual PWM switching frequency (kHz) | Actual switching frequency used by drive |
| P00-33 | Critical fault counter – O-I | These parameters log the number of times specific faults or errors occur, and are |
| P00-34 | Critical fault counter – O-Volts | useful for diagnostic purposes |
| P00-35 | Critical fault counter – U-Volts | |
| P00-36 | Critical fault counter – O-temp (h/sink) | |
| P00-37 | Critical fault counter – b O-I (chopper) | |
| P00-38 | Critical fault counter – O-hEAt (control) | |
| P00-39 | Modbus comms error counter | |
| P00-40 | CANbus comms error counter | |
| P00-41 | I/O processor comms errors | |
| P00-42 | Power stage uC comms errors | |
| P00-43 | Drive power up time (life time) (Hours) | Total lifetime of drive with power applied |
| P00-44 | Phase U current offset & ref | Internal value |
| P00-45 | Phase V current offset & ref | Internal value |
| P00-46 | Phase W current offset & ref | Internal value |
| P00-47 | Index 1: Fire mode total active time Index 2: Fire Mode Activation Count | Total activation time of Fire Mode Displays the number of times Fire Mode has been activated |
| P00-48 | Scope channel 1 & 2 | Displays signals for first scope channels 1 & 2 |
| P00-49 | Scope channel 3 & 4 | Displays signals for first scope channels 3 & 4 |
| | | |

7. Analog and Digital Input Macro Configurations

7.1. Overview

Optidrive E3 uses a Macro approach to simplify the configuration of the Analog and Digital Inputs. There are two key parameters which determine the input functions and drive behaviour:

P-12 Selects the main drive control source and determines how the output frequency of the drive is primarily controlled.

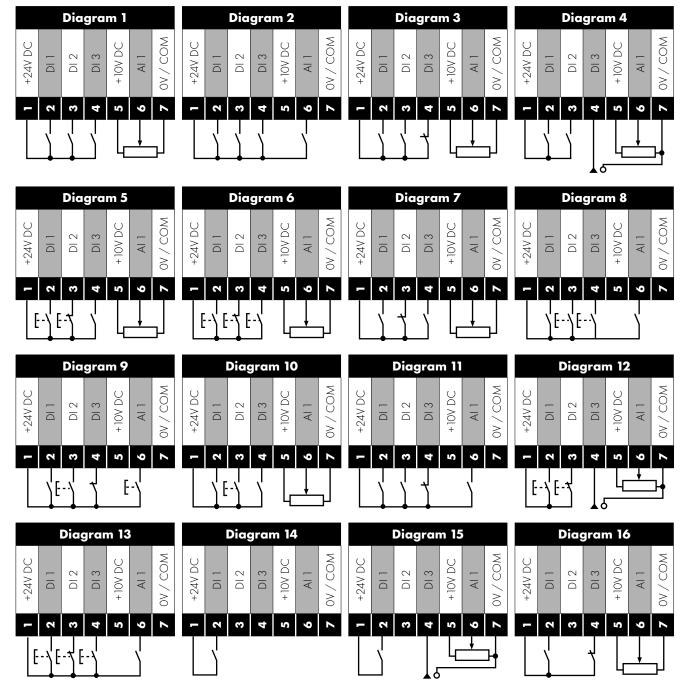

P-15 Assigns the Macro function to the analog and digital inputs.

Additional parameters can then be used to further adapt the settings, e.g.

- P-16 Used to select the format of the analog signal to be connected to analog input 1, e.g. 0 10 Volt, 4 20mA.
- P-30 Determines whether the drive should automatically start following a power on if the Enable Input is present.
- P-31 When Keypad Mode is selected, determines at what output frequency / speed the drive should start following the enable command, and also whether the keypad start key must be pressed or if the Enable input alone should start the drive.
- P-47 Used to select the format of the analog signal to be connected to analog input 2, e.g. 0 10 Volt, 4 20mA.

7.2. Example Connection Diagrams

The diagrams below provide an overview of the functions of each terminal macro function, and a simplified connection diagram for each.

7.3. Macro Functions Guide Key

The table below should be used as a key on the following pages.

| Function | Explanation |
|----------------------|--|
| STOP | Latched Input, Open the contact to STOP the drive |
| RUN | Latched input, Close the contact to Start, the drive will operate as long as the input is maintained |
| FWD' | Latched Input, selects the direction of motor rotation FORWARD |
| REVÚ | Latched Input, selects the direction of motor rotation REVERSE |
| RUN FWD | Latched Input, Close to Run in the FORWARD direction, Open to STOP |
| RUN REV ଓ | Latched Input, Close to Run in the REVERSE direction, Open to STOP |
| ENABLE | Hardware Enable Input. |
| | In Keypad Mode, P-31 determines whether the drive immediately starts, or the keypad start key must be pressed. |
| | In other modes, this input must be present before the start command is applied via the fieldbus interface. |
| START Ĵ | Normally Open, Rising Edge, Close momentarily to START the drive (NC STOP Input must be maintained) |
| ^- START -^ | Simultaneously applying both inputs momentarily will START the drive (NC STOP Input must be maintained) |
| STOP↓ | Normally Closed, Falling Edge, Open momentarily to STOP the drive |
| STARTĴFWDÙ | Normally Open, Rising Edge, Close momentarily to START the drive in the forward direction (NC STOP Input must be maintained) |
| STARTĴREVŮ | Normally Open, Rising Edge, Close momentarily to START the drive in the reverse direction (NC STOP Input must be maintained) |
| ^-FAST STOP (P-24)-^ | When both inputs are momentarily active simultaneously, the drive stops using Fast Stop Ramp Time P-24 |
| FAST STOP↓ (P-24) | Normally Closed, Falling Edge, Open momentarily to FAST STOP the drive using Fast Stop Ramp Time P-24 |
| E-TRIP | Normally Closed, External Trip input. When the input opens momentarily, the drive trips showing <i>E-tr P</i> or <i>Ptc-th</i> depending on P-47 setting |
| Fire Mode | Activates Fire Mode |
| Analog Input AI1 | Analog Input 1, signal format selected using P-16 |
| Analog Input AI2 | Analog Input 2, signal format selected using P-47 |
| AI1 REF | Analog Input 1 provides the speed reference |
| AI2 REF | Analog Input 2 provides the speed reference |
| P-xx REF | Speed reference from the selected preset speed |
| PR-REF | Preset speeds P-20 – P-23 are used for the speed reference, selected according to other digital input status |
| PI-REF | PI Control Speed Reference |
| PI FB | Analog Input used to provide a Feedback signal to the internal PI controller |
| KPD REF | Keypad Speed Reference selected |
| FB REF | Selected speed reference from Fieldbus (Modbus RTU / CAN Open / Master depending on P-12 setting) |
| (NO) | Input is Normally Open, Close momentarily to activate the function |
| (NC) | Input is Normally Closed, Open momentarily to activate the function |
| INC SPD 1 | Normally Open, Rising Edge, Close momentarily to increase the motor speed by value in P-20 |
| DEC SPD↓ | Normally Open, Rising Edge, Close momentarily to decrease the motor speed by value in P-20 |

When P15=4 in keypad mode, DI2 &DI4 are edge triggered. Digital pot speed will be increased or decreased once for each rising edge. The step of each speed change is defined by the absolute value of Pre-set Speed 1 (P-20). NOTE

Speed change only happens during normal running condition (no stop command etc.). Digital pot will be adjusted between minimum speed (P-02) and maximum speed (P-01).

P1 Setpoint source is selected by P-44 (default is fixed value in P-45, AI 1 may also be selected). P1 Feedback source is selected by P-46 (default is AI 2, other options may be selected).

7.8. Fire Mode

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation. The Fire Mode input may be a normally open (Close to Activate Fire Mode) or Normally Closed (Open to Activate Fire Mode) according to the setting of P-30 Index 2. In addition, the input may be momentary or maintained type, selected by P-30 Index 3.

This input may be linked to a fire control system to allow maintained operation in emergency conditions, e.g. to clear smoke or maintain air quality within that building.

The fire mode function is enabled when P-15 = 15, 16 or 17, with Digital Input 3 assigned to activate fire mode.

Fire Mode disables the following protection features in the drive:

D-L (Heat-sink Over-Temperature), U-L (Drive Under Temperature), Lh-FLL (Faulty Thermistor on Heat-sink), E-Lr ,P (External Trip), 4-20 F (4-20mA fault), Ph-1 b (Phase Imbalance), P-Lo55 (Input Phase Loss Trip), 5C-LrP (Communications Loss Trip), 1_L-LrP (Accumulated overload Trip).

The following faults will result in a drive trip, auto reset and restart:

D-uoLE (Over Voltage on DC Bus), U-uoLE (Under Voltage on DC Bus), H D-I (Fast Over-current Trip), D-I (Instantaneous over current on drive output), DUE-F (Drive output fault, Output stage trip).

8. Modbus RTU Communications

8.1. Introduction

The Optidrive E3 can be connected to a Modbus RTU network via the RJ45 connector on the front of the drive.

8.2. Modbus RTU Specification

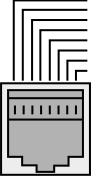

| Protocol | Modbus RTU |
|--------------------------|--|
| Error check | CRC |
| Baud rate | 9600bps, 19200bps, 38400bps, 57600bps, 115200bps (default) |
| Data format | 1 start bit, 8 data bits, 1 stop bits, no parity |
| Physical signal | RS 485 (2-wire) |
| User interface | RJ45 |
| Supported Function Codes | 03 Read Multiple Holding Registers 06 Write Single Holding Register 16 Write Multiple Holding Registers (Supported for registers 1 – 4 only) |

8.3. RJ45 Connector Configuration

For full MODBUS RTU register map information please refer to your Invertek Drives Sales Partner. Local contacts can be found by visiting our website:

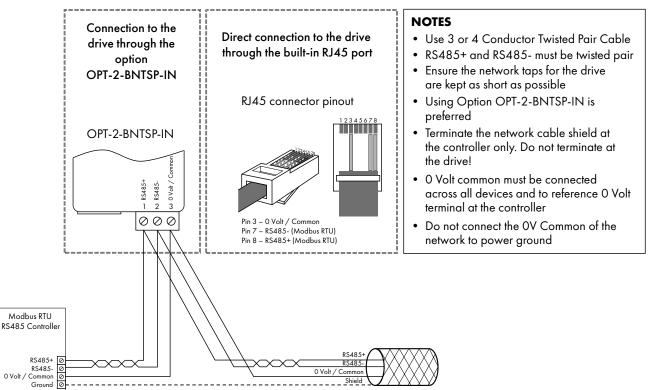

www.invertekdrives.com

When using MODBUS control the Analog and Digital Inputs can be configured as shown in section 7.6. Macro Functions - Fieldbus Control Mode (P-12 = 3, 4, 7, 8 or 9).

| 1 | CAN - | | | | | |
|----|--|--|--|--|--|--|
| 2 | CAN + | | | | | |

| 4 | -RS485 (PC) | | | | | |
| 5 | +RS485 (PC) | | | | | |
| 6 | +24 Volt | | | | | |
| 7 | -RS485 (Modbus RTU) | | | | | |
| 8 | +RS485 (Modbus RTU) | | | | | |
| We | Warnina: This is not an Ethernet connection. | | | | | |

Warning: This is not an Ethernet connection. Do not connect directly to an Ethernet port.

8

8.4. Modbus Register Map

| Register | Par. | Туре | | pport tion C | | Fun | ction | Range | Explanation | |
|----------|--------|------|----|-----------------|----|------------------------------------|-------------------------|--------|--|--|
| Number | | | 03 | 06 | 16 | Low Byte | High Byte | | | |
| 1 | - | R/W | ~ | ~ | v | Drive Contr | ol Command | 03 | 16 Bit Word. Bit 0: Low = Stop, High = Run Enable Bit 1: Low = Decel Ramp 1 (P-04), High = Decel Ramp 2 (P-24) Bit 2: Low = No Function, High = Fault Reset Bit 3: Low – No Function, High = Coast Stop Request | |
| 2 | - | R/W | ~ | ~ | ~ | Modbus Speed reference setpoint | | 05000 | Setpoint frequency x10, e.g. 100 = 10.0Hz | |
| 4 | - | R/W | ~ | ~ | ~ | | ation and ation Time | 060000 | Ramp time in seconds x 100, e.g. 250 = 2.5 seconds | |
| 6 | - | R | v | | | Error code | Drive status | | Low Byte = Drive Error Code, see section 10.1. Fault Code Messages High Byte = Drive Status as follows: O: Drive Stopped 1: Drive Running 2: Drive Tripped | |
| 7 | | R | ~ | | | Output Motor Frequency | | 020000 | Output frequency in Hz x10, e.g. 100 = 10.0Hz | |
| 8 | | R | ~ | | | Output M | otor Current | 0480 | Output Motor Current in Amps x 10, e.g. 10 = 1.0 Amps | |
| 11 | - | R | ~ | | | Digital input status | | 015 | Indicates the status of the 4 digital inputs Lowest Bit = 1 Input 1 | |
| 20 | POO-01 | R | ~ | | | Analog In | put 1 value | 01000 | Analog input % of full scale x10, e.g. 1000 = 100% | |
| 21 | P00-02 | R | ~ | | | Analog In | put 2 value | 01000 | Analog input % of full scale x10, e.g. 1000 = 100% | |
| 22 | P00-03 | R | ~ | | | Speed Reference Value | | 01000 | Displays the setpoint frequency $\times 10$, e.g. $100 = 10.0$ Hz | |
| 23 | P00-08 | R | ~ | | | DC bus | s voltage | 01000 | DC Bus Voltage in Volts | |
| 24 | P00-09 | R | ~ | | | Drive ter | mperature | 0100 | Drive heatsink temperature in °C | |

All user configurable parameters are accessible as Holding Registers, and can be Read from or Written to using the appropriate Modbus command. The Register number for each parameter P-04 to P-60 is defined as 128 + Parameter number, e.g. for parameter P-15, the register number is 128 + 15 = 143. Internal scaling is used on some parameters, for further details please contact your Invertek Drives Sales Partner.

9. Technical Data

9.1. Environmental

| Operational ambient temperature range | Open Drives | : | -10 50°C (frost and condensation free) |
|---------------------------------------|-------------|-------|--|
| Storage ambient temperature range | | : | -40 60°C |
| Maximum altitude | | : | 2000m. Derate above 1000m: 1% / 100m |
| Maximum humidity | | : | 95%, non-condensing |
| | | 0.1.1 | |

NOTE For UL compliance: the average ambient temperature over a 24 hour period for 200-240V, 2.2kW and 3HP, IP20 drives is 45°C.

9.2. Rating Tables

Technical Data

NOTE Cable sizes shown are the maximum possible that may be connected to the drive. Cables should be selected according to local wiring codes or regulations at the point of installation.

9.3. Single Phase Operation of Three Phase Drives

All drive models intended for operation from three phase mains power supply (e.g. model codes ODE-3-xxxxx-3xxx) may be operated from a single phase supply at up to 50% of maximum rated output current capacity.

In this case, the AC power supply should be connected to L1 (L) and L2 (N) power connection terminals only.

9.4. Additional Information for UL Compliance

Optidrive E3 is designed to meet the UL requirements. For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333. In order to ensure full compliance, the following must be fully observed.

| Supply Voltage | 200 – 240 RMS Volts for 230 Volt rated units, + /- 10% variation allowed. 240 Volt RMS Maximum. | | | | | | | | | |
|---------------------------------------|---|---------------------------|---------------------------|----------------------------|---|--|--|--|--|--|
| | 380 – 480 Volts for 400 Volt rated units, + / - 10% variation allowed, Maximum 500 Volts RMS. | | | | | | | | | |
| Imbalance | Maximum 3% voltage variation between phase – phase voltages allowed. | | | | | | | | | |
| | All Optidrive E3 units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive tripping. For inpu supplies which have supply imbalance greater than 3% (typically the Indian sub-continent & parts of Asia Pacific including China) Invertek Drives recommends the installation of input line reactors. | | | | | | | | | |
| Frequency | 50 – 60Hz + / - 5% Variation | | | | | | | | | |
| Short Circuit | Voltage Rating | | Maximum suppl | y short-circuit current | | | | | | |
| Capacity | voliage kaling | Min kW (HP) | Max kW (HP) | 5ka RMS (AC) | 100ka RMS (AC) | | | | | |
| | 115V | 0.37 (0.5) | 1.1 (1.5) | J-Type fuses | J-Type fuses | | | | | |
| | 230V | 0.37 (0.5) | 11 (15) | J-Type fuses | J-Type fuses | | | | | |
| | 230V | 15 (20) | 18.5 (25) | J-Type fuses | Semiconductor fuse (FWP-100 Bussmann | | | | | |
| | 400 / 460V | 0.37 (0.5) | 22 (30) | J-Type fuses | J-Type fuses | | | | | |
| | 400 / 460V | 30 (40) | 37 (50) | J-Type fuses | Semiconductor fuse (FWP-100 Bussmann | | | | | |

4.8.2. Motor Thermistor Connection.

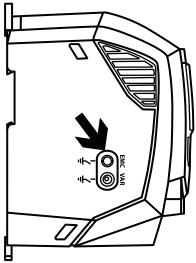

9.5. EMC Filter Disconnect

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected (on IP20 units only) by completely removing the EMC screw on the side of the product.

Remove the screw as indicated right.

The Optidrive product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply.

When carrying out a HiPot (Flash) test on an installation in which the drive is built, the voltage surge suppression components may cause the test to fail. To accommodate this type of system HiPot test, the voltage surge suppression components can be disconnected by removing the VAR screw After completing the HiPot test, the screw should be replaced and the HiPot test repeated. The test should then fail, indicating that the voltage surge suppression components are once again in circuit.

10. Troubleshooting

10.1. Fault Code Messages

| Fault Code | No. | Description | Suggested Remedy |
|---------------|-----|--------------------------------------|---|
| no-Fit | 00 | No Fault | Not required. |
| 01-ь | 01 | Brake channel over current | Check external brake resistor condition and connection wiring. |
| OL-br | 02 | Brake resistor overload | The drive has tripped to prevent damage to the brake resistor. |
| 0-1 | 03 | Output Over Current | Instantaneous Over current on the drive output. Excess load or shock load on the motor. |
| | | | NOTE Following a trip, the drive cannot be immediately reset. A delay time is inbuilt, which allows the power components of the drive time to recover to avoid damage. |
| 1_6-6-8 | 04 | Motor Thermal Overload (12t) | The drive has tripped after delivering >100% of value in P-08 for a period of time to prevent damage to the motor. |
| 0-uolt | 06 | Over voltage on DC bus | Check the supply voltage is within the allowed tolerance for the drive. If the fault occurs on deceleration or stopping, increase the deceleration time in P-04 or install a suitable brake resistor and activate the dynamic braking function with P-34. |
| U-uolt | 07 | Under voltage on DC bus | The incoming supply voltage is too low. This trip occurs routinely when power is removed from the drive. If it occurs during running, check the incoming power supply voltage and all components in the power feed line to the drive. |
| 0-E | 08 | Heatsink over temperature | The drive is too hot. Check the ambient temperature around the drive is within the drive specification. Ensure sufficient cooling air is free to circulate around the drive. |
| U- E | 09 | Under temperature | Trip occurs when ambient temperature is less than - 10°C. Temperature must be raised over - 10°C in order to start the drive. |
| P-dEF | 10 | Factory Default parameters loaded | |
| E-Er iP | 11 | External trip | E-trip requested on digital input 3. Normally closed contact has opened for some reason. If motor thermistor is connected check if the motor is too hot. |
| 50-065 | 12 | Optibus comms loss | Check communication link between drive and external devices. Make sure each drive in the network has its unique address. |
| FLE-dc | 13 | DC bus ripple too high | Check incoming supply phases are all present and balanced. |
| P-1055 | 14 | Input phase loss trip | Check incoming power supply phases are present and balanced. |
| h 0-1 | 15 | Output Over Current | Check for short circuits on the motor and connection cable. |
| | | | NOTE Following a trip, the drive cannot be immediately reset. A delay time is inbuilt, which allows the power components of the drive time to recover to avoid damage. |
| £h-F∟£ | 16 | Faulty thermistor on heatsink | |
| dAFA-E | 17 | Internal memory fault (IO) | Press the stop key. If the fault persists, consult you supplier. |
| 4-20 F | 18 | 4-20mA Signal Lost | Check the analog input connection(s). |
| dAFA-E | 19 | Internal memory fault (DSP) | Press the stop key. If the fault persists, consult you supplier. |
| F-PEc | 21 | Motor PTC thermistor trip | Connected motor thermistor over temperature, check wiring connections and motor. |
| FAn-F | 22 | Cooling Fan Fault (IP66 only) | Check / replace the cooling fan. |
| 0-hEAE | 23 | Drive internal temperature too high | Drive ambient temperature too high, check adequate cooling air is provided. |
| DUE-F | 26 | Output Fault | Indicates a fault on the output of the drive, such as one phase missing, motor phase currents not balanced. Check the motor and connections. |
| AFE-05 | 41 | Autotune Fault | The motor parameters measured through the autotune are not correct. Check the motor cable and connections for continuity. Check all three phases of the motor are present and balanced. |
| 5C-FO I | 50 | Modbus comms loss fault | Check the incoming Modbus RTU connection cable. Check that at least one register is being polled cyclically within the timeout limit set in P-36 Index 3. |
| 5C-F02 | 51 | CAN comms loss trip | Check the incoming CAN connection cable. Check that cyclic communications take place within the timeout limit set in P-36 Index 3. |

NOTE Following an over current or overload trip (3, 4, 5, 15), the drive may not be reset until the reset time delay has elapsed to prevent damage to the drive.
